# The Standard Model of Particle Physics

## particles & interactions

$$\begin{aligned}
 \mathcal{L} = & -\frac{1}{4}F_{\mu\nu}F^{\mu\nu} \\
 & + i\bar{\Psi}\not{D}\psi \\
 & + D_\mu\Phi^\dagger D^\mu\Phi - V(\Phi) \\
 & + \bar{\Psi}_L\hat{Y}\Phi\Psi_R + h.c.
 \end{aligned}$$

# The Standard Model of Particle Physics

## probing it at colliders

# The Large Hadron Collider and its detectors

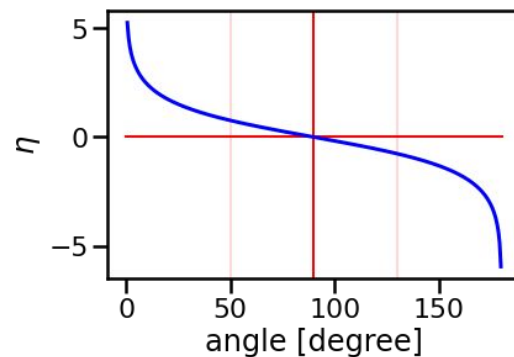

# The Large Hadron Collider and its detectors

# Hadron colliders kinematic variables

Relevant kinematic variables:

- Transverse momentum:  $p_T$
- Rapidity:  $y = \frac{1}{2} \cdot \ln \left( \frac{E-p_z}{E+p_z} \right)$
- Pseudorapidity:  $\eta = -\ln \tan \frac{1}{2}\theta$
- Azimuthal angle:  $\varphi$

# Hadron colliders

## protons are not fundamental!

# The Large Hadron Collider experiments

## what is the outcome of a collision?

# Hadron colliders

## jets, jets and more jets

2 clear jets

3 jets?

3 jets?  
or 4 jets?

Reconstructing jets is an ambiguous task!

# Hadron colliders

## jets, jets and more jets

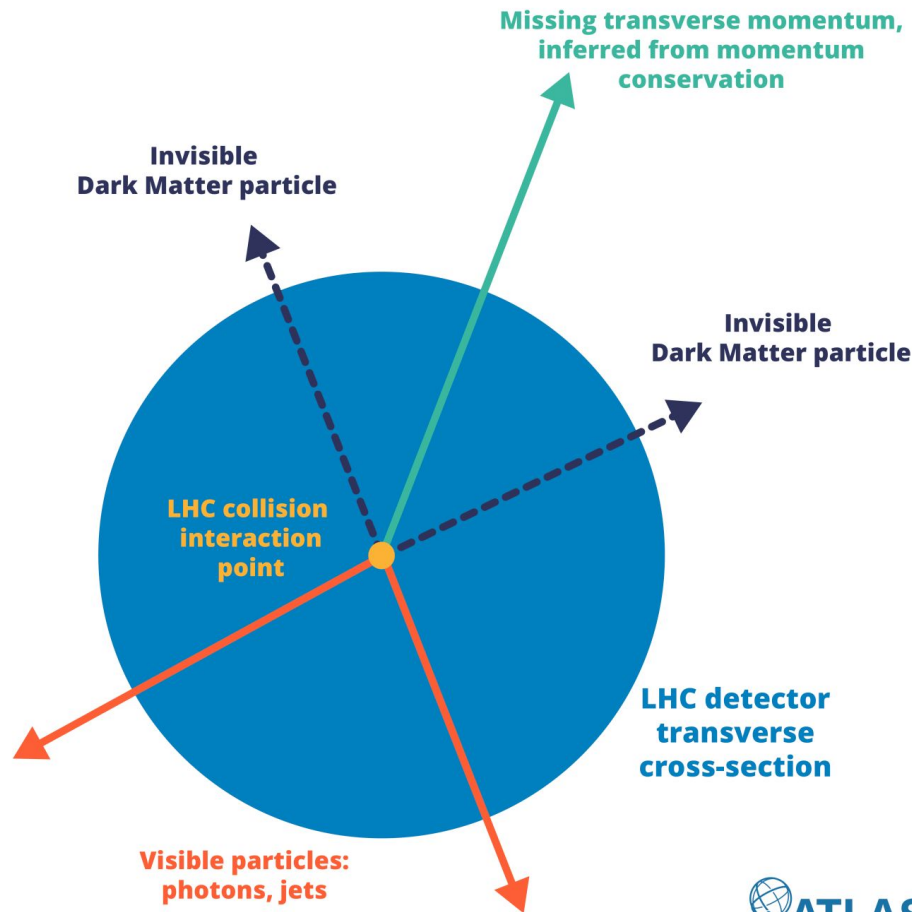

Reconstructing jets is an ambiguous task!

# Energy balance

missing transverse energy (MET)

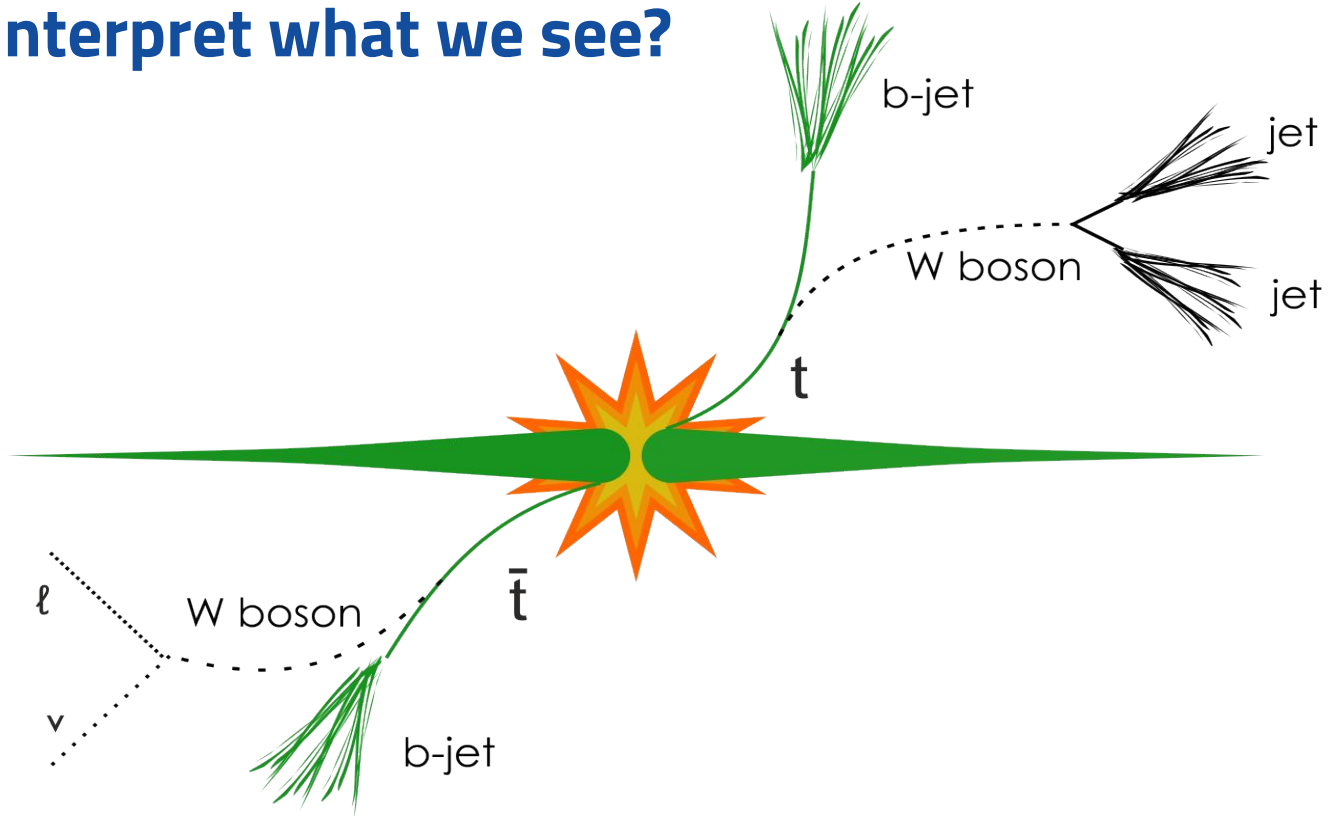

$$\vec{p}_T^{\text{miss}} = - \sum_i \vec{p}_T^i$$

transverse momentum  
of each visible particle

# The Large Hadron Collider experiments

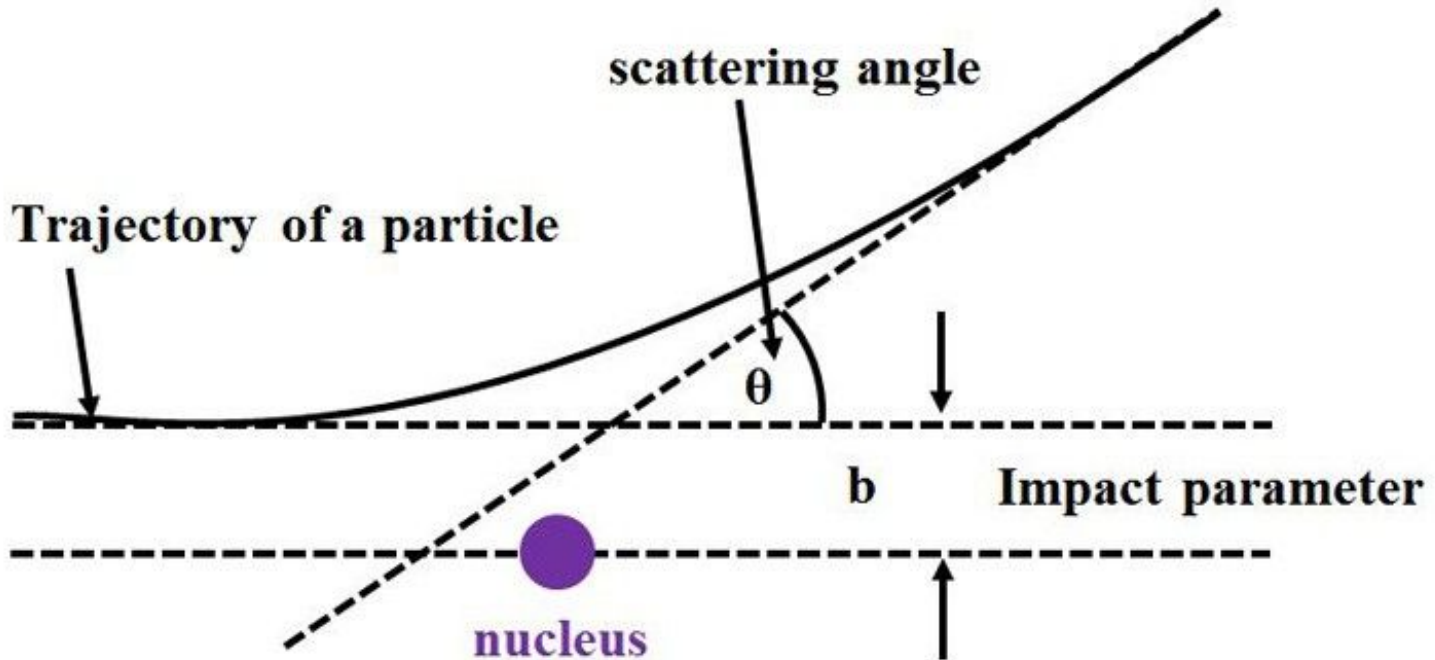

## how to interpret what we see?

# The Large Hadron Collider experiments how to interpret what we see?

# “Probability” for a collision to happen cross-section

# “Probability” for a collision to happen differential cross-section

# The Large Hadron Collider experiments

## counting events

**Number of observed events**

just count ...

**Background**

measured from data or  
calculated from theory

$$\sigma = \frac{N^{\text{obs}} - N^{\text{bkg}}}{\int \mathcal{L} dt \cdot \epsilon}$$

**Luminosity**

determined by accelerator,  
triggers, ...

**Efficiency**

many factors, optimized  
by experimentalist

# The Large Hadron Collider experiments

## counting events

$$L = f \frac{nN_a N_b}{A} = f \frac{nN_a N_b}{4\pi\sigma_x\sigma_y}$$

LHC:

$N_x$	$\sim 10^{11}$
$A$	$\sim .0005 \text{ mm}^2$
$n$	$\sim 2800$
$f$	$\sim 11 \text{ kHz}$
$L$	$\sim 10^{34} \text{ cm}^{-2} \text{ s}^{-1}$

$N_a$ :	number of particles per bunch (beam A)
$N_b$ :	number of particles per bunch (beam B)
$U$ :	circumference of ring
$n$ :	number of bunches per beam
$v$ :	velocity of beam particles
$f$ :	revolution frequency
$A$ :	beam cross-section
$\sigma_x$ :	standard deviation of beam profile in x
$\sigma_y$ :	standard deviation of beam profile in y

# What can we do with the LHC data?

*probe the Standard Model!*

Comparing with  
theory predictions

*excellent agreement*

Standard Model Total Production Cross Section Measurements

Status: February 2022

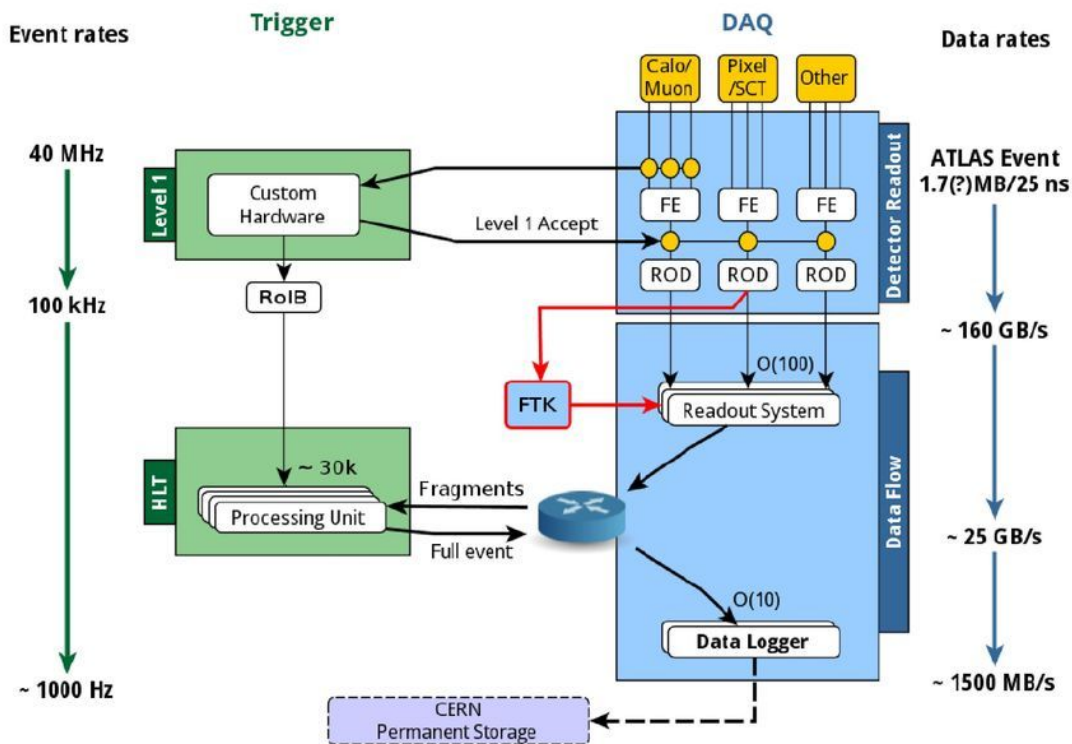

# The LHC experiments

## the need to select events

# The LHC experiments

## the need to select events: triggers

# doing a data analysis!

## the need to select events

<http://opendata.atlas.cern>

- triggers
- define the physics objects
  - jets
  - electrons
  - muons
  - taus
  - photons
  - MET
  - ...
- define the good set of cuts to increase the signal to background ratio

## Higgs boson production in the $H \rightarrow WW$ decay channel in the two-lepton final state

## Higgs boson production in the $H \rightarrow WW$ decay channel in the two-lepton final state

looking for events with two charged isolated leptons (electrons or muons) and (almost) no jets

Higgs boson production in the  $H \rightarrow WW$   
decay channel in the two-lepton final state

$$p_\mu = \left( \frac{E}{c}, p_x, p_y, p_z \right)$$

$$p_\mu p^\mu = -\frac{E^2}{c^2} + p_x^2 + p_y^2 + p_z^2 = -\frac{E^2}{c^2} + p^2 = m^2 c^4$$

$$E^2 = p^2 c^2 + m^2 c^4$$

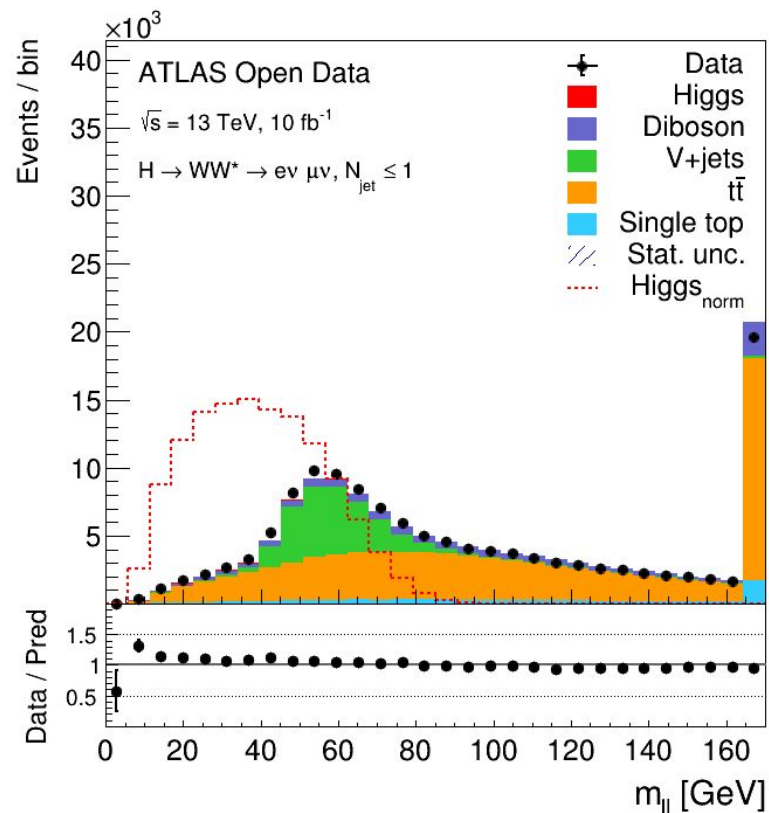

$$\hbar = c = 1$$

<http://opendata.atlas.cern>

So, let's look at the dilepton invariant mass!

(still no hint for a signal)

<http://opendata.atlas.cern>

## be clever and select “good” events!

- Single-electron or single-muon trigger satisfied;
- Exactly two isolated, different-flavour opposite-sign leptons (electrons or muons) with  $p_T > 22$  and 15 GeV, respectively;
- Missing transverse momentum  $E_T^{\text{miss}}$  larger than 30 GeV;
- Exactly zero or at most one jet with  $p_T > 30$  GeV, and exactly zero  $b$ -tagged jets (MV2c10 @ 85% WP) with  $p_T > 20$  GeV;
- Azimuthal angle between  $E_T^{\text{miss}}$  and the dilepton system  $\Delta\phi(\ell\ell, E_T^{\text{miss}}) > \pi/2$ ;
- Transverse momentum of the dilepton system  $p_T^{\ell\ell} > 30$  GeV;
- The invariant mass of the two leptons  $m_{\ell\ell}$  must satisfy:  $10 \text{ GeV} < m_{\ell\ell} < 55 \text{ GeV}$ ;
- Azimuthal angle between the two leptons  $\Delta\phi(\ell, \ell) < 1.8$ .

<http://opendata.atlas.cern>

- $\gamma\gamma$  (0.2%)
- other\* (11.2%)

↓ smaller BR,  
higher purity  
(generally)

# What can we do with the LHC data?

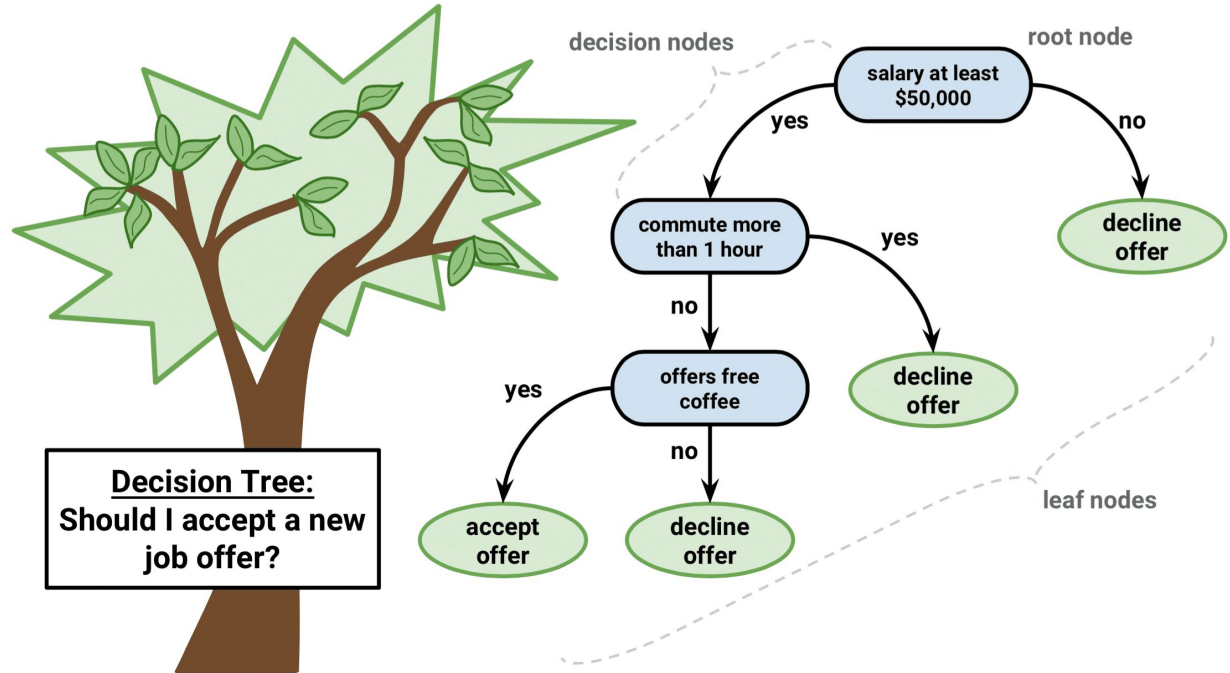

*probe the Standard Model - the Higgs boson and its properties*

# What can we do with the LHC data?

*probe the Standard Model - the Higgs boson and its properties*

machine learning:  
decision trees

# Shallow Learning

## Decision Tree

- $\vec{x}$  input features
- Labeled samples of data: **blue**/**pink**
- Partitions the data to increase sample purity
- Finds optimal criteria  $x_i > c_i$  to separate data categories
- Category prediction based on the label of the majority samples of the end leaf
- Core of the most popular algorithms used in LHC event classification (Boosted Decision Trees)

# What can we do with the LHC data?

*probe the Standard Model - the Higgs boson and its properties*

# What can we do with the LHC data?

*probe the Standard Model - the Higgs boson and its properties*

# Why going beyond the Standard Model?

*there must be new physics!*

This is us!

# What can we do with the LHC data?

*probe the Standard Model - and search for new phenomena beyond it!*

- Why should we search for new physics beyond the Standard Model?
  - we *must* leave no stone unturned in data
  - ... and we have good motivations to think that new physics exists
    - mass hierarchy of the fermions
    - matter/anti-matter asymmetry
    - dark matter
    - ...

# What can we do with the LHC data?

probe the Standard Model - and search for new phenomena beyond it!

# What can we do with the LHC data?

*probe the Standard Model - and search for new phenomena beyond it!*

- If we assume that the Standard Model is the low energy limit of a more general theory at higher energy
  - the Higgs boson mass can be calculable (and not a free parameter):

$$M_H^2 = 3.2734594296342905438674964732159643$$

"bare mass"

$$-3.2734594296342905438674964732159645$$

$$= 10^{-32} \quad (\text{in planck units})$$

quantum corrections, e.g. 

# searching for the unknown

## *an example: the hierarchy problem*

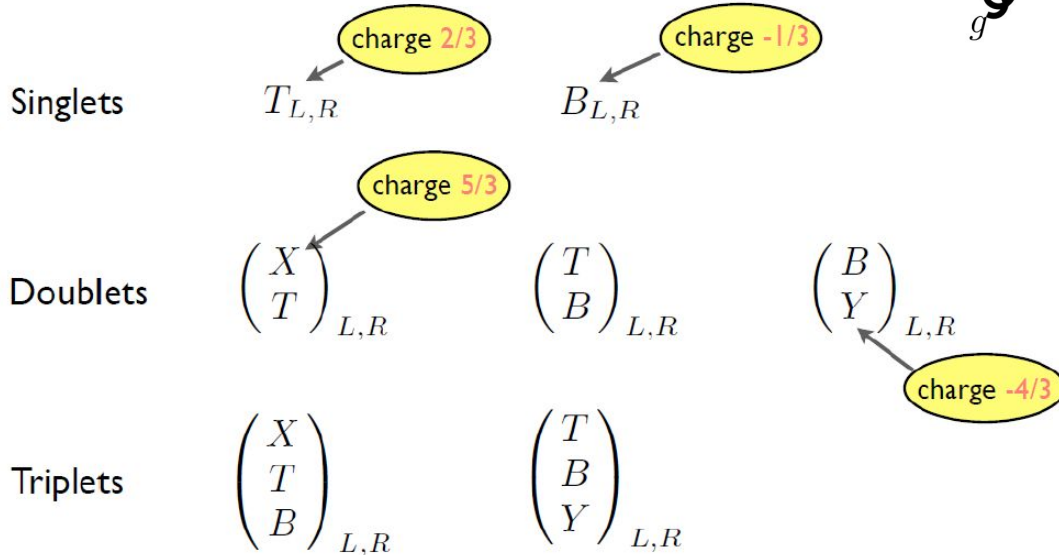

- The *natural* solution for this balancing in mass without fine-tuning is to have counter terms originating from new heavy particles (top partners)

$$M_H^2 \sim 10 - 9 = 1 \text{ (in units of } \sim 100 \text{ GeV squared)}$$

# searching for the unknown

*an example: vector-like quarks*

# searching for the unknown

## *an example: vector-like quarks*

- Many different topologies
- Looking for extremely small signals
- *Advanced analysis methods are mandatory!*

# Artificial Neuron

- $x$  is the input feature
- $y$  is the target feature (or "label")
- $w, b$  are the model trainable parameters
- $\hat{y}$  is the output (model prediction)

## Activation function

- e.g. linear for regression
- e.g. sigmoid for classification

$$f(x) = \frac{1}{1 + e^{-x}} \rightarrow \hat{y}$$

# Loss function and Training Objective

**Loss function**  $L$ : measure of how good is  $\hat{y}$  in predicting  $y$

- e.g. Mean squared error:  $L = \frac{1}{N} \sum_i^N (y_i - \hat{y}_i)^2$
- e.g. Binary cross-entropy:  $L = \frac{1}{N} \sum_i^N y_i \cdot \log(\hat{y}_i) + (1 - y_i) \cdot \log(1 - \hat{y}_i)$

**Training objective:** find  $w, b$  that minimise the Loss function

# Gradient Descent and Back-propagation

Loss minimisation: **descend the Loss surface**

- Loss gradient

**Back-propagate** the Loss gradient (iteratively)

- and update
- and update
- is an hyper-parameter that adjusts the learning rate

Loss surface

# Deep Learning

- Neural networks with many hidden layers, each with a given number of artificial neurons
- Capable of highly non-linear representations of the data
- In principle, can model any function
- Architecture -> hyper-parameters: number of layers, number of neurons/layer, ...

# Practicable Deep Neural Networks

Many layers + many units

- **Vanishing gradient:** new activation functions made training possible (ReLU) (~2010)
- Advances in hardware: **GPU** increased speed of computation by 100 (~2010)
- APIs: **Keras, Tensorflow** (2015)

Deep learning

- Many parameters to estimate:
- **Data** thirst
