Higgs Physics

Oeiras - 2023

p.1

What is the Higgs?

The Higgs is an elementary particle

- with spin zero (scalar);
- without electric charge (a priori, it should not see the photons from the electromagnetic interaction...);
- without colour (a priori, it should not see the gluons from the strong interaction...).
- Between 1964 and 2012 the Higgs was not discovered... The Higgs was invented! It was invented for theoretical reasons!!

Higgs invented! Why?

- 1. to give mass to the particles mediating the weak interaction, W^{\pm} and Z^{0} ;
- 2. to give mass to the matter particles, eg. electron.

Higgs invented! Why?

1. Why don't you just give a mass to W[±] and Z⁰?

It contradicts gauge invariance.

• Why do you want gauge invariance?

A: To keep probabilities smaller than 1!

*Not*e: As a side-dish, there is an elegant way to invent interactions called "the gauge principle".

Higgs invented! Why?

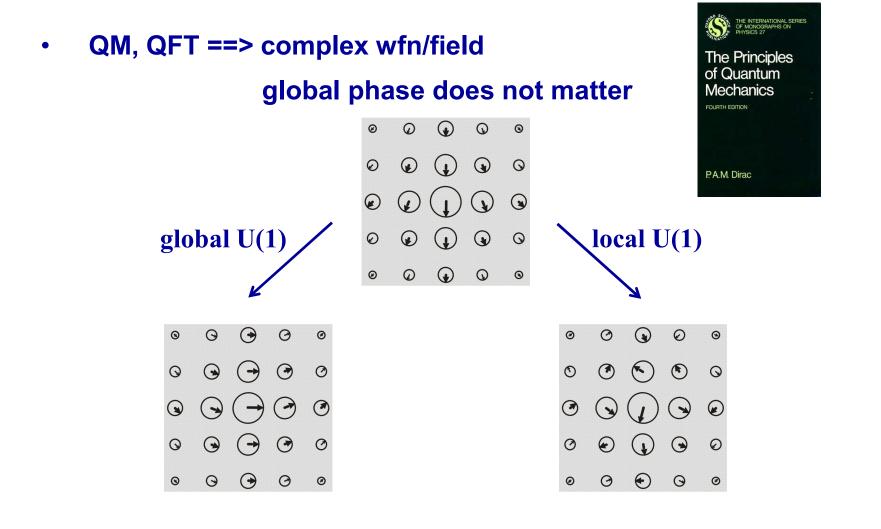

2. Why don't you just give a mass to the electron?

It contradicts gauge invariance.

How does it contradict gauge invariance?

Answer in steps:

- electron sees W ==> e_L must be in a doublet under SU(2)_L
- W interaction violates parity maximally ==> e_R is singlet
- mass links left-handed e_L and right-handed electron e_R
- cannot make mass term only with e_L and e_R (need Higgs help)

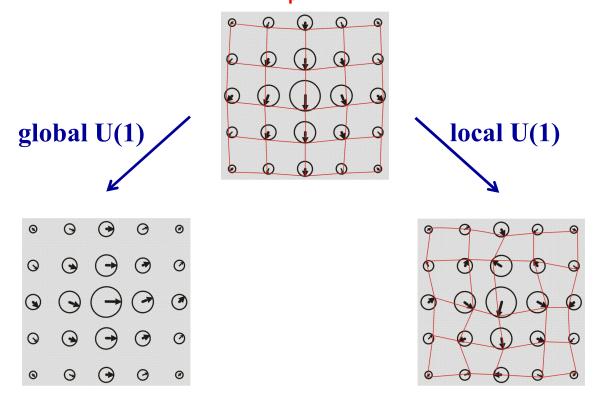

João Silva/Jorge Romão

Higgs Physics

Oeiras - 2023

• QM, QFT ==> local phase matters

connection $A_{\boldsymbol{\mu}}$ takes care of it

João Silva/Jorge Romão

Higgs Physics

$$\mathcal{L} = (\partial_{\mu}\phi)^{\dagger}(\partial^{\mu}\phi) - V(\phi) \qquad \qquad V(\phi) = m^2 |\phi|^2 \left[+\lambda |\phi|^4 \right]$$

Euler-Lagrange:

$$0 = -\frac{\partial \mathcal{L}}{\partial \phi^{\dagger}} + \partial_{\mu} \frac{\partial \mathcal{L}}{\partial (\partial_{\mu} \phi^{\dagger})} = \left(\partial_{\mu} \partial^{\mu} - m^2\right) \phi \quad \text{Klein-Gordon}$$

$$\mathcal{L} = (\partial_{\mu}\phi)^{\dagger}(\partial^{\mu}\phi) - V(\phi) \qquad \qquad V(\phi) = m^{2} |\phi|^{2} \left[+\lambda |\phi|^{4} \right]$$

global transf.: $\phi \to \phi' = e^{iq\alpha} \phi \Rightarrow \mathcal{L} \to \mathcal{L}$

local transf.: $\phi \to \phi' = e^{iq \alpha(x)} \phi \Rightarrow \mathcal{L} \to ?$

$$\partial_{\mu}\phi'^{\dagger} = e^{-iq\alpha(x)} \left[\partial_{\mu}\phi^{\dagger} - iq\phi^{\dagger}\partial_{\mu}\alpha(x)\right]$$

$$\partial^{\mu}\phi' = e^{iq\alpha(x)} \left[\partial^{\mu}\phi + iq\phi\partial^{\mu}\alpha(x)\right]$$

$$(\partial_{\mu}\phi')^{\dagger}(\partial^{\mu}\phi') = (\partial_{\mu}\phi)^{\dagger}(\partial^{\mu}\phi) - iq \left[\phi^{\dagger}(\partial^{\mu}\phi) - (\partial^{\mu}\phi)^{\dagger}\phi\right] \partial_{\mu}\alpha$$

$$+q^{2}|\phi|^{2}(\partial_{\mu}\alpha)(\partial^{\mu}\alpha)$$

* charged particle in EM field ==> minimal coupling

 $i\partial^{\mu} \rightarrow i\partial^{\mu} - qA^{\mu} \implies \partial^{\mu} \rightarrow D^{\mu} = \partial^{\mu} + iqA^{\mu}$ covariant derivative

Oeiras - 2023

* gauge transformation of gauge field
$$A_{\mu} \rightarrow A'_{\mu} = A_{\mu} - \partial_{\mu}\alpha$$

 $(D_{\mu}\phi)' = (\partial_{\mu} + iq A'_{\mu}) e^{iq\alpha(x)}\phi$
 $= e^{iq\alpha(x)} [iq(\partial_{\mu}\alpha)\phi + (\partial_{\mu}\phi) + iq A_{\mu}\phi - iq(\partial_{\mu}\alpha)\phi]$
 $= e^{iq\alpha(x)} D_{\mu}\phi$
 $\mathcal{L} = (D_{\mu}\phi)^{\dagger} (D^{\mu}\phi) - V(\phi) - \frac{1}{4}F^{\mu\nu}F_{\mu\nu} \rightarrow \mathcal{L}$
kinetic ϕ self ϕ Electromagnetism
+ int. w/ gauge fields (for free!)
João Silva/Jorge Romão Higgs Physics Oeiras - 2023 p.10

the gauge principle

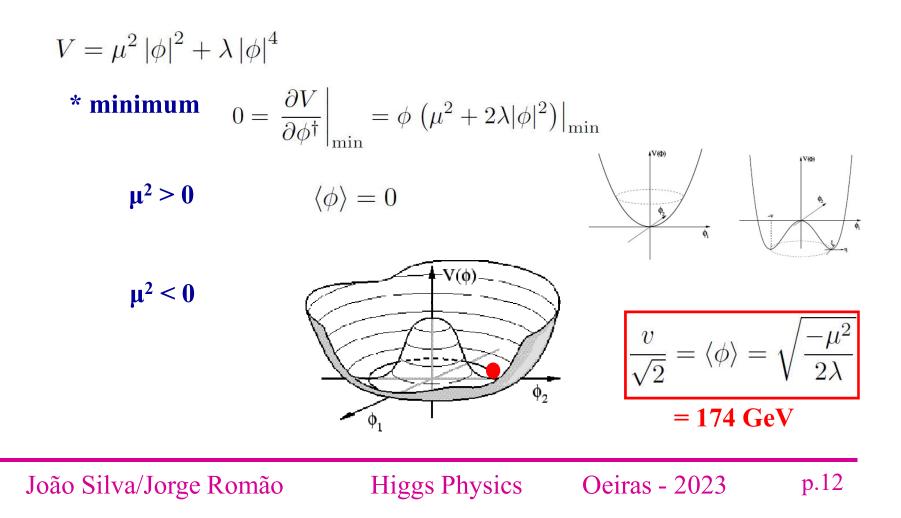

- ask for gauge invariance of matter field
- introduce via the covariant derivative one gauge field for each group generator
- include gauge transformations of gauge fields
- include kinetic terms for gauge fields ==> interactions of gauge fields
- ==> gauge fields have no mass

 $m_A^2 A^\mu A_\mu \quad \bigstar \quad m_A^2 A^\mu A_\mu$

==> no longitudinal polarization (only 2 dof)

Spontaneous Symmetry Breaking

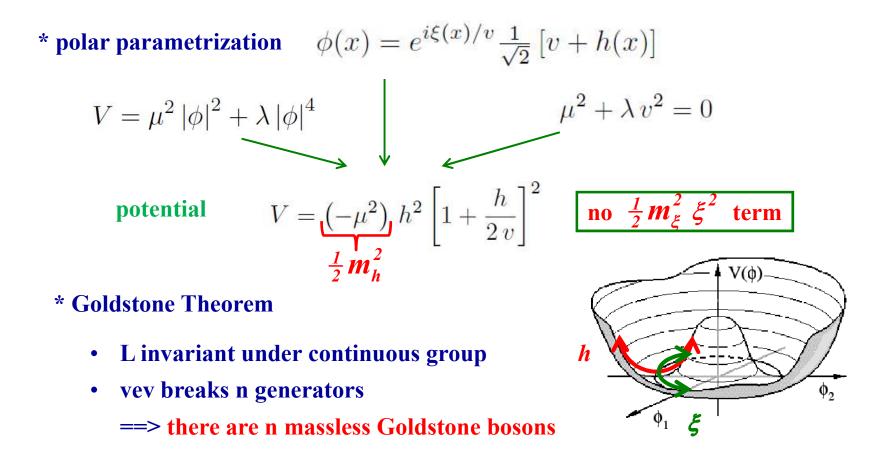

The Lagrangian has a symmetry which is broken by the vacuum.

 \star

Spontaneous Symmetry Breaking Homework 1

 \star

The SSB/gauge miracle

PROBLEMS

- 1. Gauge symmetry ==> massless Gauge boson (2 \perp polarizations)
- 2. SSB ==> massless Goldstone boson

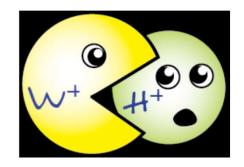

(1 dof/broken generator)

²(2 ____ polarizations) + Go b. "eaten" as _____ massive Gauge boson

F. Englert and R. Brout, PRL 13 (1964) 321.
P. W. Higgs, Phys.Lett. 12 (1964) 132, PRL 13 (1964) 508.
G. Guralnik, C. Hagen, and T. Kibble, PRL 13 (1964) 585.

The SSB/gauge miracle

The W⁺ "eats" the Goldstone boson and makes it its longitudinal dof.

Flip Tanedo: https://www.quantumdiaries.org/2011/10/10/who-ate-the-higgs/. http://www.quantumdiaries.org/2011/06/19/helicity-chirality-mass-and-the-higgs/.

p.15

Oeiras - 2023

The SSB/gauge miracle Homework 2

 \star

p.16

* polar parametrization $\phi(x) = e^{i\xi(x)/v} \frac{1}{\sqrt{2}} \left[v + h(x) \right]$ $(\partial_{\mu}\phi)^{\dagger}(\partial^{\mu}\phi)$ $\searrow |D\phi|^2 = \left| \left(\partial + iq A \right) \phi \right|^2 = \left| \left(\partial + iq A \right) e^{i\xi/v} \frac{1}{\sqrt{2}} \left[v + h \right] \right|^2$ $= \frac{1}{2} \left| (\partial h) + i(v+h) \left[\frac{(\partial \xi)}{v} + q A \right] \right|^2$ $= \frac{1}{2} (\partial_{\mu} h) (\partial^{\mu} h) + \frac{1}{2} (qv)^{2} \left[A_{\mu} + \frac{1}{qv} \partial_{\mu} \xi \right]^{2} \left[1 + \frac{h}{v} \right]^{2}$ = A'_{μ} (gauge transf.) mass term for A'_u

The SSB/gauge miracle

- the massless GoB ξ disappears
- it is absorbed as the longitudinal polarization of A'_{μ} (dof 2 + 1 = 3)
- A'_µ gets a mass proportinal to v
- there is a new massive scalar field h "the Higgs boson"
- the coupling of hAA is proportional to m_A^2
- the fermions also get mass through Higgs
- the couplings hff are proportional to m_f

The Higgs Mechanism

* polar parametrization $\phi(x) = e^{i\xi(x)/v} \frac{1}{\sqrt{2}} [v + h(x)]$

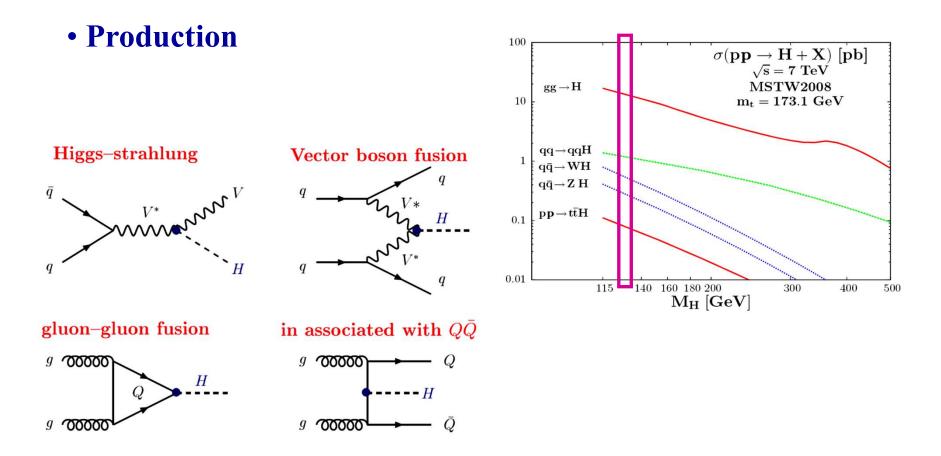

kinetic term
$$(\partial_{\mu}\phi)^{\dagger} (\partial^{\mu}\phi) = \frac{1}{2}(\partial_{\mu}h) (\partial^{\mu}h) + \frac{1}{2}(\partial_{\mu}\xi) (\partial^{\mu}\xi) \left[1 + \frac{h}{v}\right]^{2}$$

potential $V = \left(-\mu^{2}\right) h^{2} \left[1 + \frac{h}{2v}\right]^{2}$
 $\frac{\frac{1}{2}m_{h}^{2}}{\frac{\sqrt{2}}{\sqrt{2}}} = \langle\phi\rangle = \sqrt{\frac{-\mu^{2}}{2\lambda}} = 174 \text{ GeV}$
 $m_{h} = \sqrt{-2\mu^{2}} = 125 \text{ GeV}$

==> All SM parameters fixed; all predictions

Higgs boson production at the LHC (in Run-2 numbers)

LHC = 'Large Higgs Creator'

During Run-2, the LHC produced almost 8 million Higgs bosons!

Channel	Produced	Selected		Mass resolution
$H \rightarrow \gamma \gamma$	18,200		6,440	1–2%
$H \rightarrow ZZ^{\star}$	210,000	$(\rightarrow 4\ell)$	210	1–2%
$H \rightarrow WW^{\star}$	1,680,000	$(\rightarrow 2\ell 2\nu)$	5,880	20%
$H \rightarrow \tau \tau$	490,000		2,380	15%
$H \rightarrow bb$	4,480,000		9,240	10% _{A. Hoecker}

While this is enormous, the number of selected events is much smaller, due to:

- Need to select final states with small backgrounds (typically require a lepton) and good resolution to measure the small Higgs signal
- · Small branching ratios for lepton final states

Why 1 Higgs?

- # Spin 1 fixed by gauge group: SU(3)xSU(2)xU(1) => W^{\pm} , Z^{0} , γ , $g_{1..8}$
- Nothing fixes # Spin 1/2: Settled by experiment

• Nothing fixes # Spin 0: MUST be settled by experiment

Novelties in Multi-Higgs

- Multiple spin-0 particles
 - Neutral: Scalar (h, H)
 Pseudoscalar (A)
 Mixed (h1, h2, h3)
 - Charged (H[±])
- Rich vacuum structure
 - May have charge breaking minimum
 - May have two local minima of unequal depths

Novelties in Multi-Higgs

- CP violation in the Higgs sector
 - Theory: ExplicitSpontaneous
 - Experiment: Scalar-pseudoscalar mixing Mixing of charged Higgs Diagonal coupling to fermions Off-diagonal coupling to fermions (FCNSI)

Scalar potential of the 2HDM

$$\begin{split} V_H &= m_{11}^2 \Phi_1^{\dagger} \Phi_1 + m_{22}^2 \Phi_2^{\dagger} \Phi_2 - \left[m_{12}^2 \Phi_1^{\dagger} \Phi_2 + \text{H.c.} \right] \\ &+ \frac{1}{2} \lambda_1 (\Phi_1^{\dagger} \Phi_1)^2 + \frac{1}{2} \lambda_2 (\Phi_2^{\dagger} \Phi_2)^2 + \lambda_3 (\Phi_1^{\dagger} \Phi_1) (\Phi_2^{\dagger} \Phi_2) + \lambda_4 (\Phi_1^{\dagger} \Phi_2) (\Phi_2^{\dagger} \Phi_1) \\ &+ \left[\frac{1}{2} \lambda_5 (\Phi_1^{\dagger} \Phi_2)^2 + \lambda_6 (\Phi_1^{\dagger} \Phi_1) (\Phi_1^{\dagger} \Phi_2) + \lambda_7 (\Phi_2^{\dagger} \Phi_2) (\Phi_1^{\dagger} \Phi_2) + \text{H.c.} \right], \end{split}$$

★

Conclusions

- We have entered a new phase in the study of Elwk SB: the precision phase
- The # of Higgs is to be determined experimentally
- Current experiments already constrain the models

Conclusions

- Radical situations still viable: eg. scalar coupling to up and pseudoscalar coupling to down
- Beware of panic vacuum

 Multi-Higgs models constitute a very exciting and active field

Multi-Higgs Workshops
