The Atlas of Cancer Images

User roles

Data Provider/Data Holder/Data Controller

Definition: Any natural or legal person, including entities, bodies, and research organisations in the health or care sectors, as well as European Union institutions, bodies, offices, and agencies, who has the right, obligation, or capability to make certain data available, including registering, providing, restricting access, or exchanging the data.

Two options for joining the federation:

- Become a federated node
- Upload anonymised data to the central storage.

Tool Provider

Definition: Entity (startups, enterprises. research institutions. government agencies, non-profit organisations) that would like to contribute with processing tools, services, or applications they have developed the **EUCAIM's** to marketplace for use in the federated processing module of the platform.

Both batch and interactive applications, following well-defined rules for participation and technical compliance guidelines.

Data User-Researcher

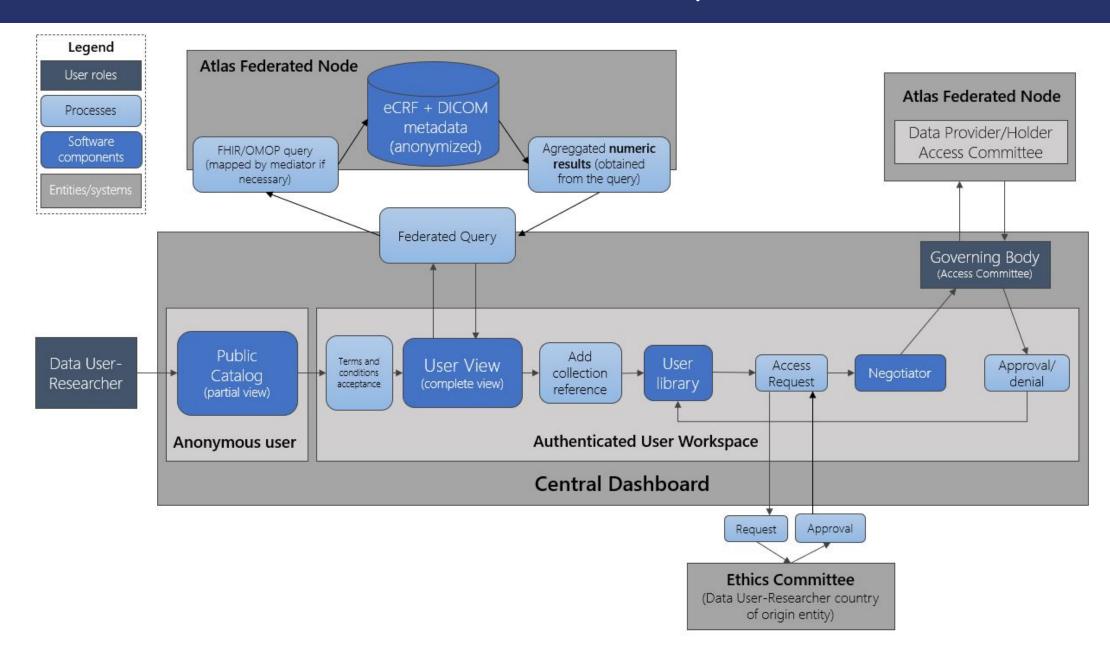

Definition: A person or entity that wants to explore the public catalogue and eventually request access to data and process them using either the tools available in the platform or their own AI tools to conduct studies, research, or analysis with the intention of generating new knowledge in the field of medicine and publishing the findings.

A data access request should be made through a Research and Development (R&D) project that will be evaluated by the Access Committee.

Data Access and Request

Software Architecture Design Objectives

Federated

It should provide services that discover, request, access and process data without requiring transferring the data out of the provider's borders.

Extensible

It should be possible to extend to new providers at a reasonable effort.

Open and Standardised

- It should follow open standards for the specification of APIs, data and protocols.

- Efficient

 It should be able to integrate high-performance resources for storage and processing

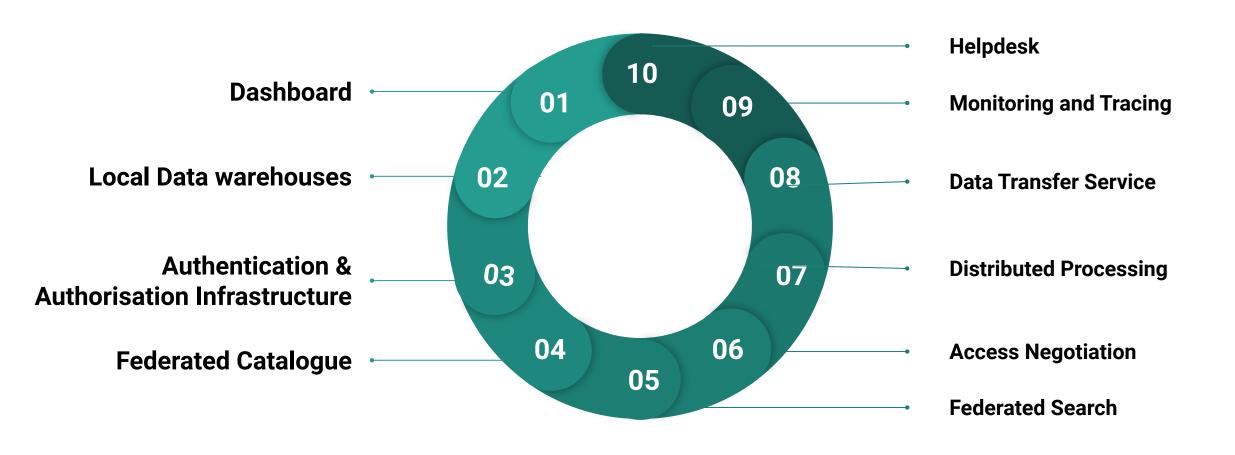

Secure

Privacy, security and auditability by design.

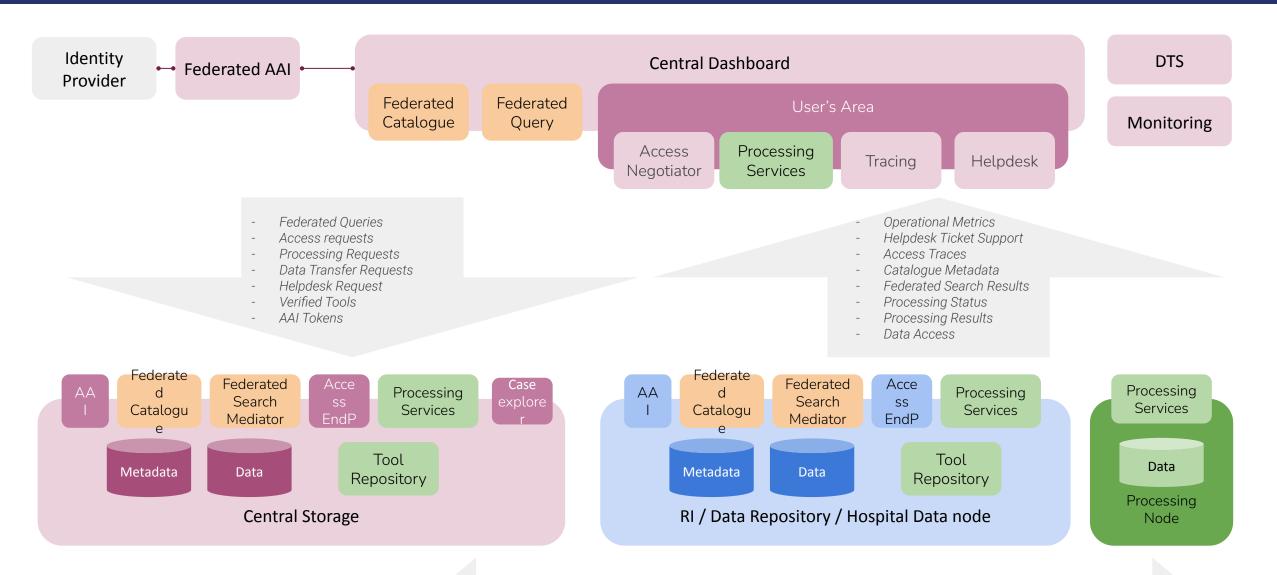

Architecture Components

Overview of the Architecture

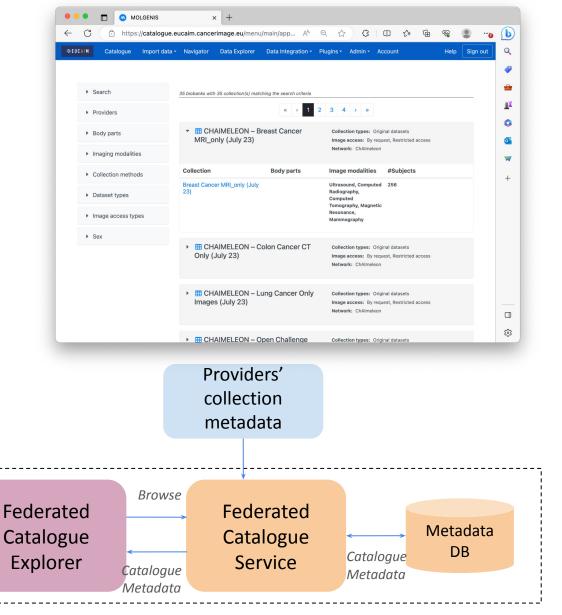

A Federated Catalogue

Explore

Dashboard

- A federated catalogue indexes the collections from the providers of the federation and the central storage.
- Collections' metadata is registered in the Federated Catalogue Service
 - Collections metadata follow a common metadata model.
- These data is shown by the Federated Catalogue explorer within the Dashboard.

Federated Query

- A Federated Query service can retrieve the number of cases which fulfil a searching criterion
 - Searching criteria based on selected fields of the images metadata defined by the hyperontology (E.g. Body Part, Gender, Age range, ...)
- This will require that providers have a mediator service that adapts the query to the specific format of the provider
 - Repositories may not follow EUCAIM's Aggregated Standardised Mediator hyperontology. result Local Repository Query & Standard Query Results **Federated Data Data Federated** Aggregated **Explorer Query Service** Standardised Mediator result Institutional Data Data DB Local Jun Warehouse Query & Dashboard Results API

Authentication and Authorisation Infrastructure

Policy

enforceme

nt

- A central AAI (Based on Life Sciences Login AAI) supports authentication & authorisation based on groups and roles.

Atlas

Services

- Supporting EduGAIN Identity Providers.

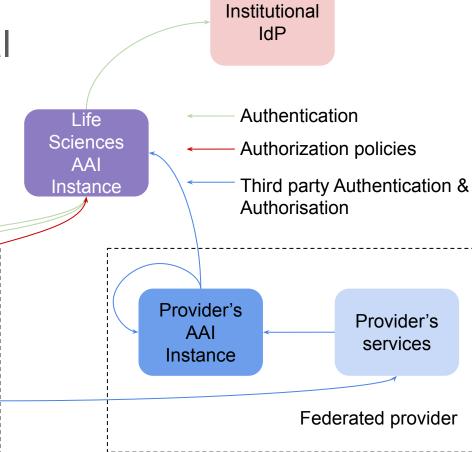

- Federated providers could trust on the central service to authenticate and authorise users.

- Policies can be defined at the Central Hub level, improving scalability.

Atlas

Dashboard

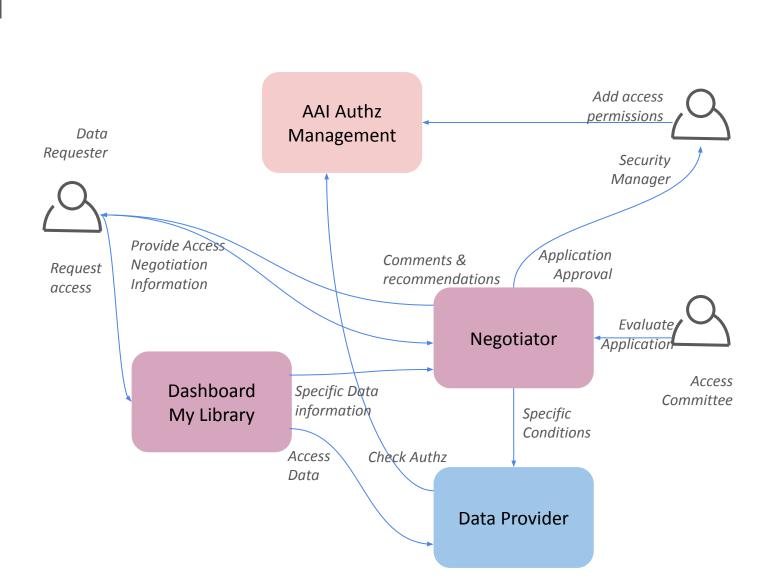

Central Hub

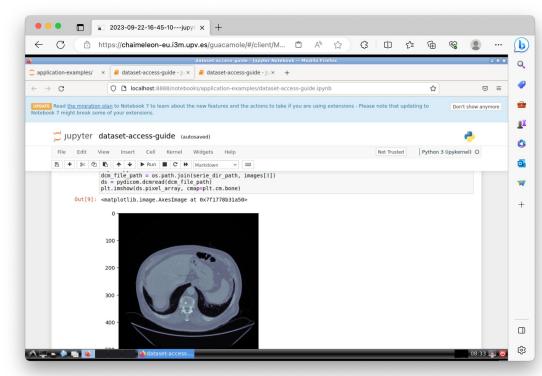

Access Negotiation

- Access to the collections will require submitting a project proposal, ethical evaluation and institutional mandates.
- Proposals will be evaluated by the Access Committee, involving the providers of the federation.
- The proposal could go through several iterations, until it gets accepted.
- Central authorisation is updated.

Access scenarios

- Three access models are foreseen
 - Data can be downloadable to the requester premises
 - This is the weakest case in terms of traceability and will apply to public datasets.
 - Data cannot be downloadable but it can be accessed in a closed, trusted environment
 - The provider will expose a Virtual Research Environment to the user, who will explore, display and process the data "in-situ".
 - Higher traceability, institutions should give permission to display data.
 - Data cannot be even visualized
 - The user can only run distributed/federated processing.
 - Higher data traceability, minimises risks by using tools from the marketplace only.

Distributed Processing

- Federated processing will trigger the execution of jobs on the providers of the federation
 - Eventually it will require temporary data transfer to a trusted processing service.
- Data must be prepared in a platform-agnostic way so processing tools can run on different providers.
 - Either copied or linked to a sandbox area.
 - Tools will be registered on a trusted central repository.

Central storage

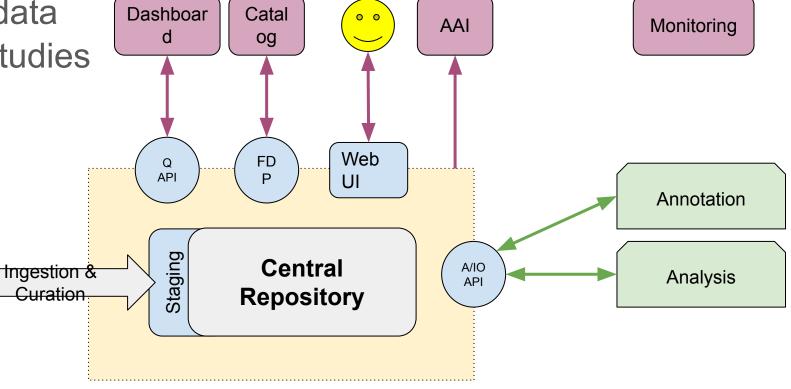

- The central storage will work technically as another node of the federation
 - It will provide storage, computing capacity and other services.

Curation

- It will store anonymous data from the observational studies and other contributors.

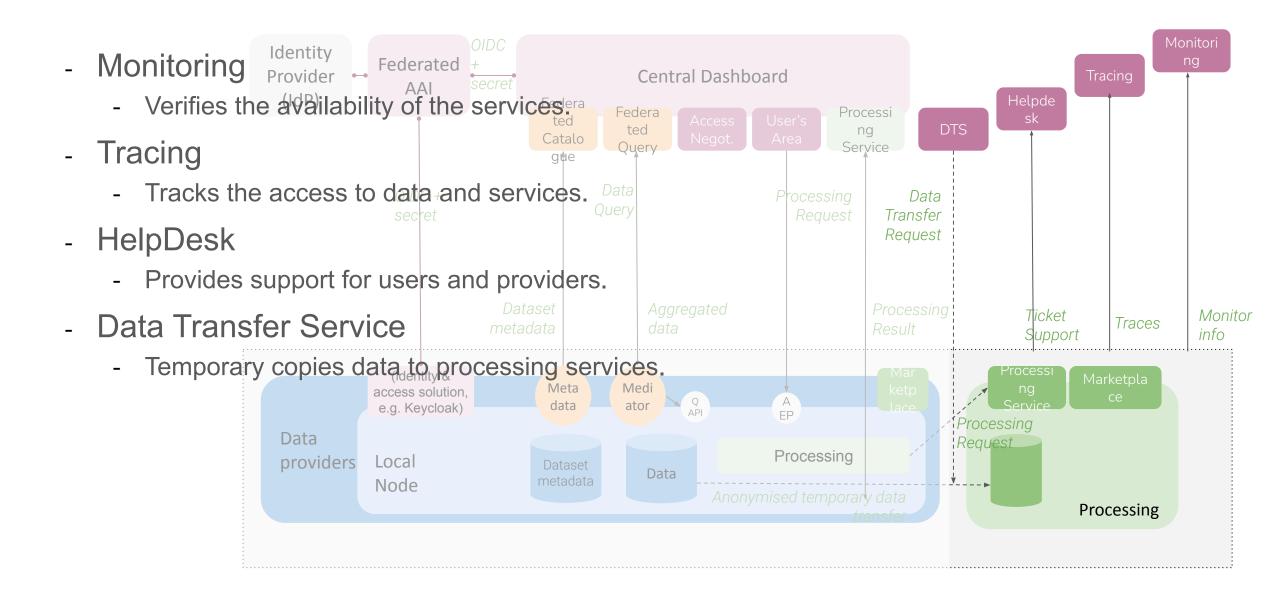

Data provider

- It will provide spaces for communities to maintain their data.

Other Components

Thank you for your attention

2023

Design completed

- Requirements analysis
- Design
- Collaboration mechanisms
- Early release of the data federation framework

2025

Final release of platform

- Federated learning
- Final version of tools and services
- Federation of new cancer images databases through open calls
- Implementation of clinical use cases

2027

Expansion

First version of platform

- Platform validated and populated for external production
- Data providers connected
- Prototype for federated learning
- Benchmarking platform

2024

Full operation of federated repository

- Integration with other data infrastructures
- · Piloting of the business model
- Legal and operation model finalised

2020
