

Heavy baryon excitations with functional calculations using a quark-diquark model

Context

Low-energy QCD \rightarrow Non-perturbative toolset
Dyson Schwinger & Bethe Salpeter equations

Objectives

Calculate **masses & structure variables**

- \rightarrow State = **Dirac** \times **Flavor** \times **Color** | All of them contribute
- \rightarrow Formulate as **eigenvalue equation** & **(M, EV)** plot
- \rightarrow Do **overlap integral** & build **extrapolation scheme**

Results

Diquark contributions

Future

The **2-body picture** still holds many mysteries!

- \rightarrow Implement more of the **qq spectrum & all flavors**
- \rightarrow Comparisons with **3-body?**
- \rightarrow Experimental quantities for **qq contributions?**
