

2nd Cycle Integrated Project in Engineering Physics

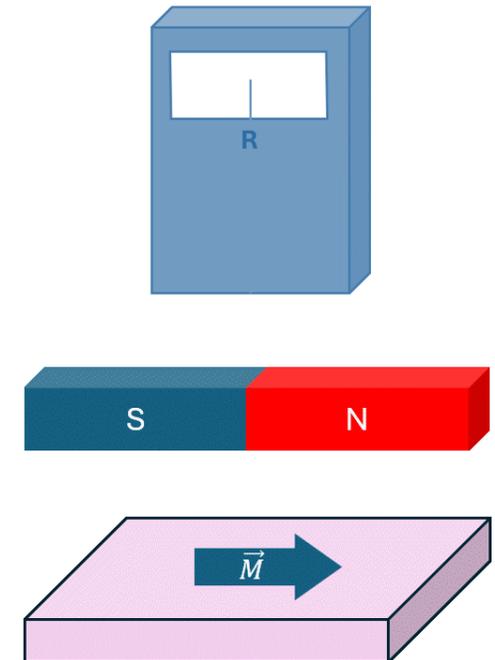

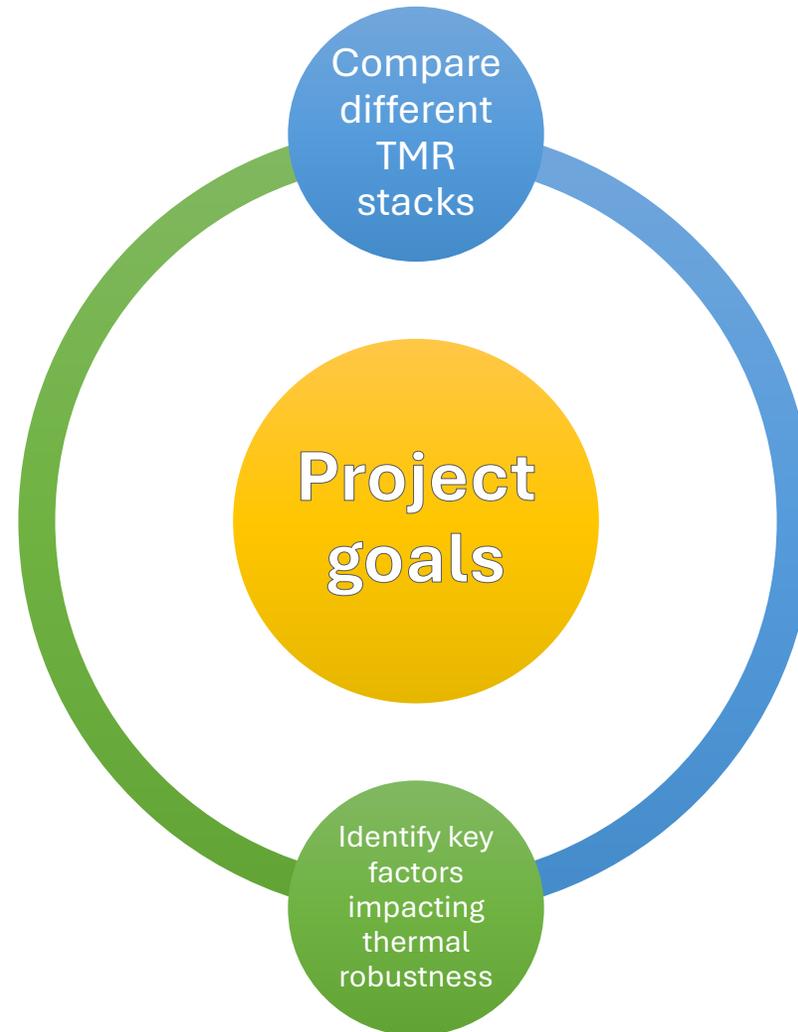

Magnetoresistive
devices for industrial
applications:
improvement of
thermal robustness

Mariana Dinis (ist1102424)

Supervisor: Prof. Susana Cardoso de Freitas

January 2026

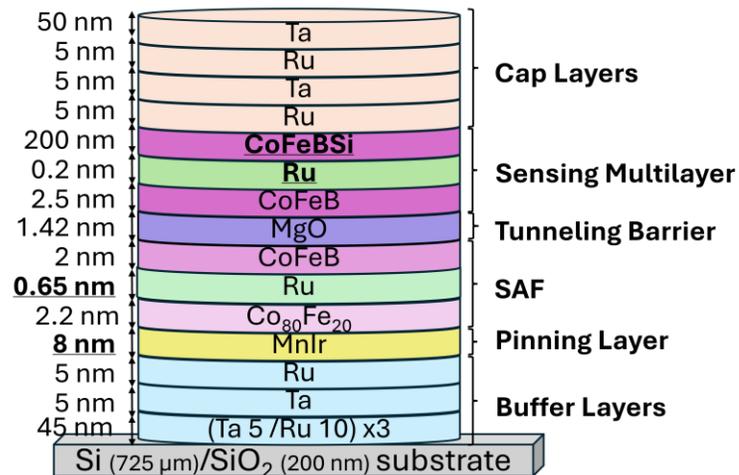

Project Goals: Recap

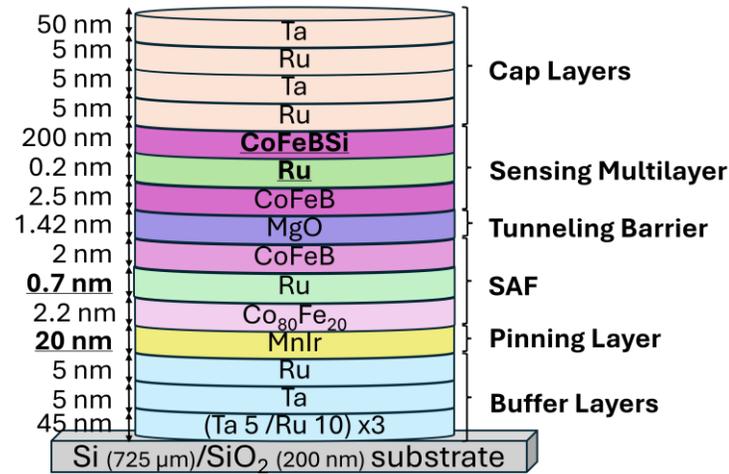

Experimental Work: Samples and their differences

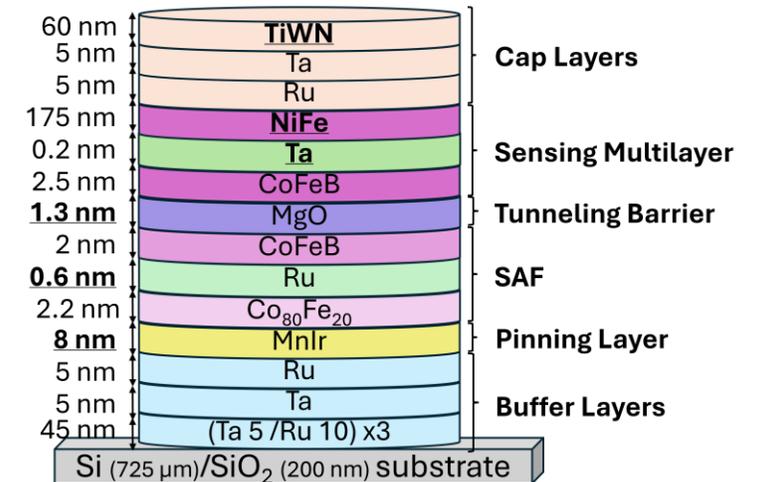

Sample 10252

Sample 10261

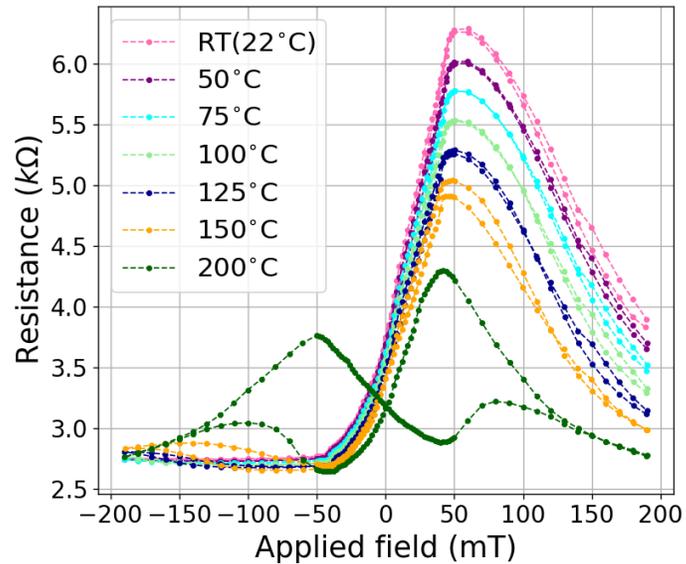

Sample 8985

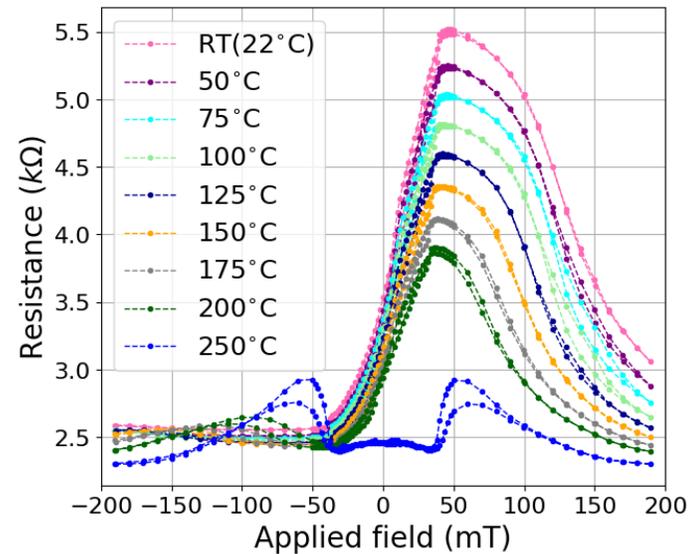

2kOe setup: Resistance as a function of the applied field

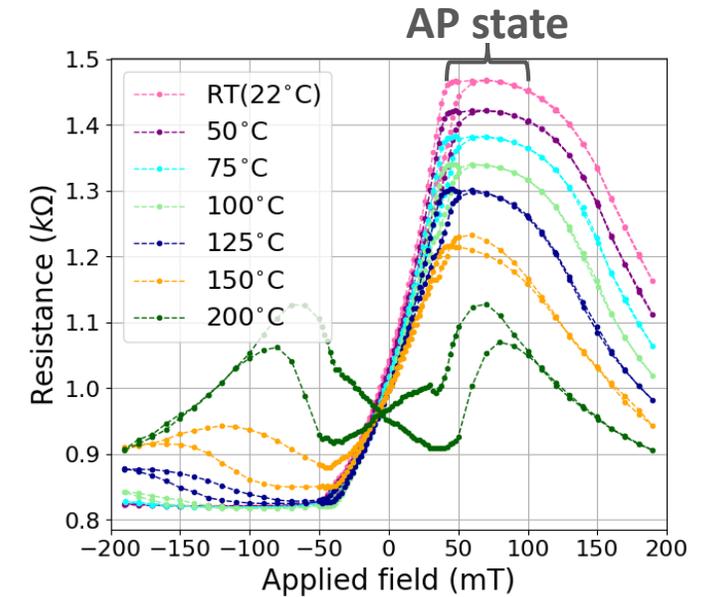

Sample 10252

Sample 10261

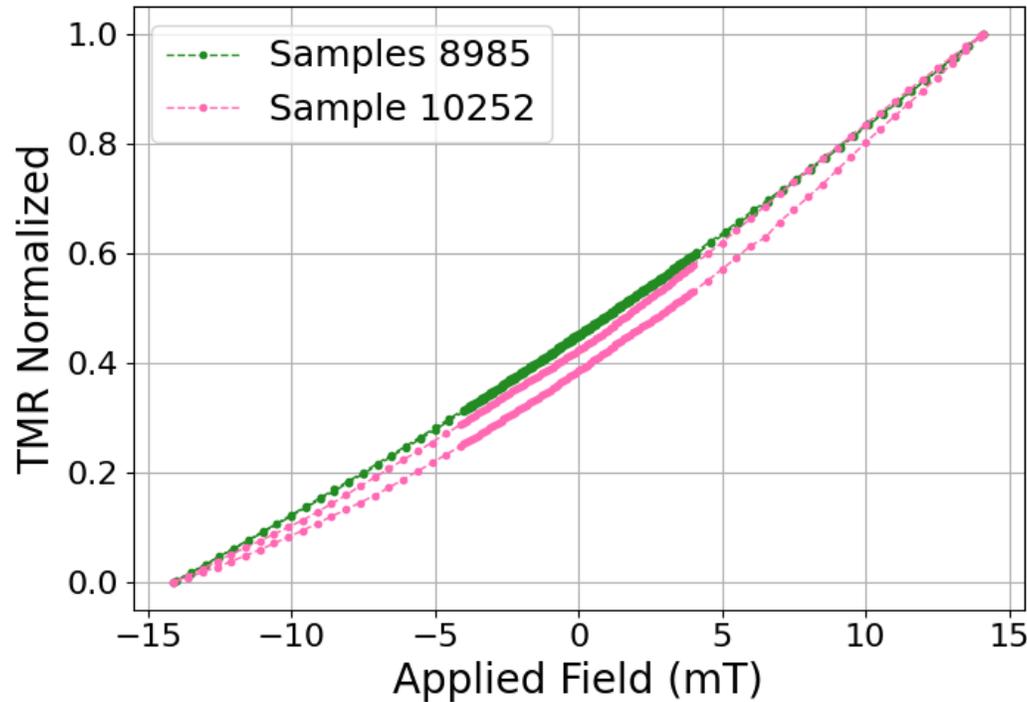

Sample 8985

10261 vs 8985

- working temperature
- AP state stability

1400e Setup: Detailed look into samples 10252 & 8985

Sample	Linearity (%)
8985	95.9
10252	91.7

Sample	H_c (mT)
8985	0.06
10252	0.56

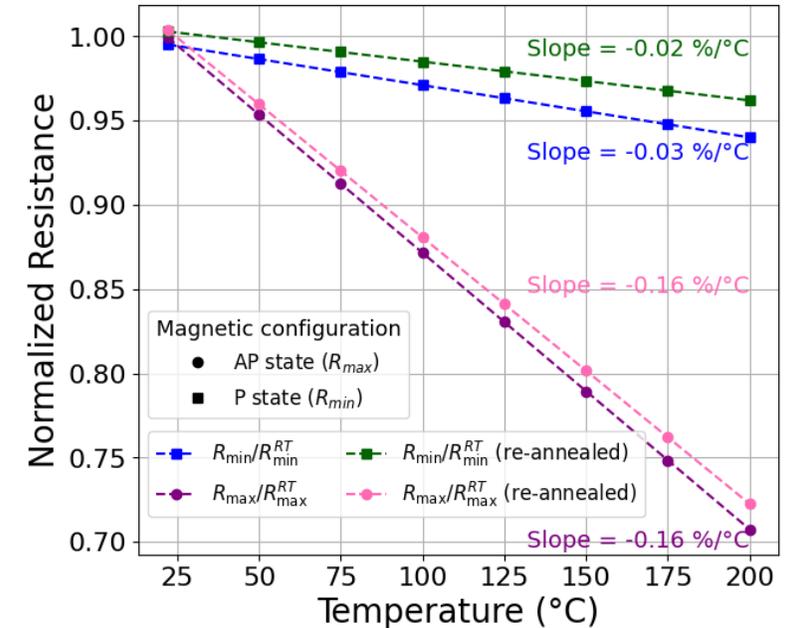

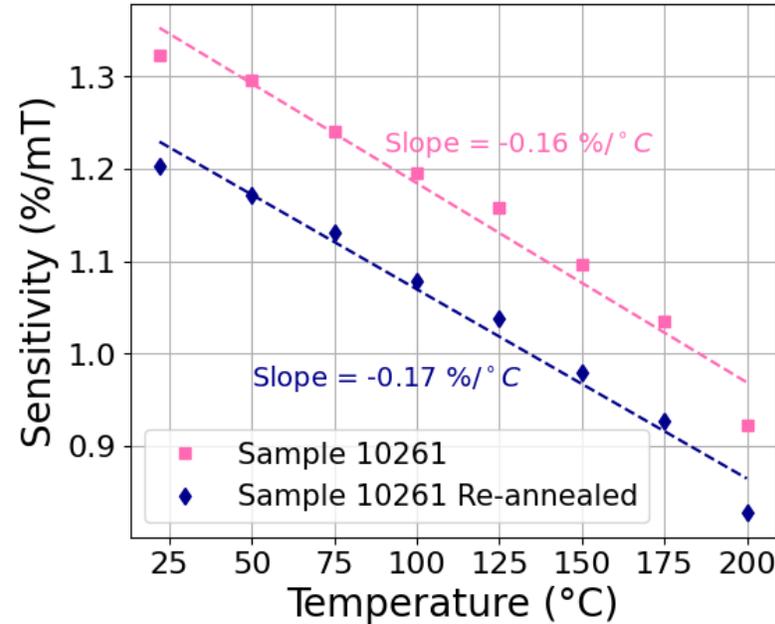

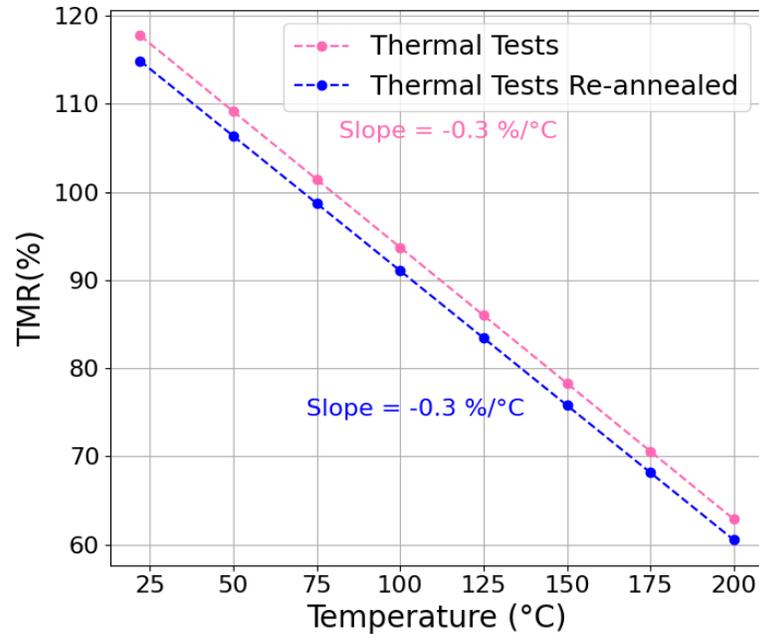

Coercivity & Linearity

- Reduced H_c values
- High linearity

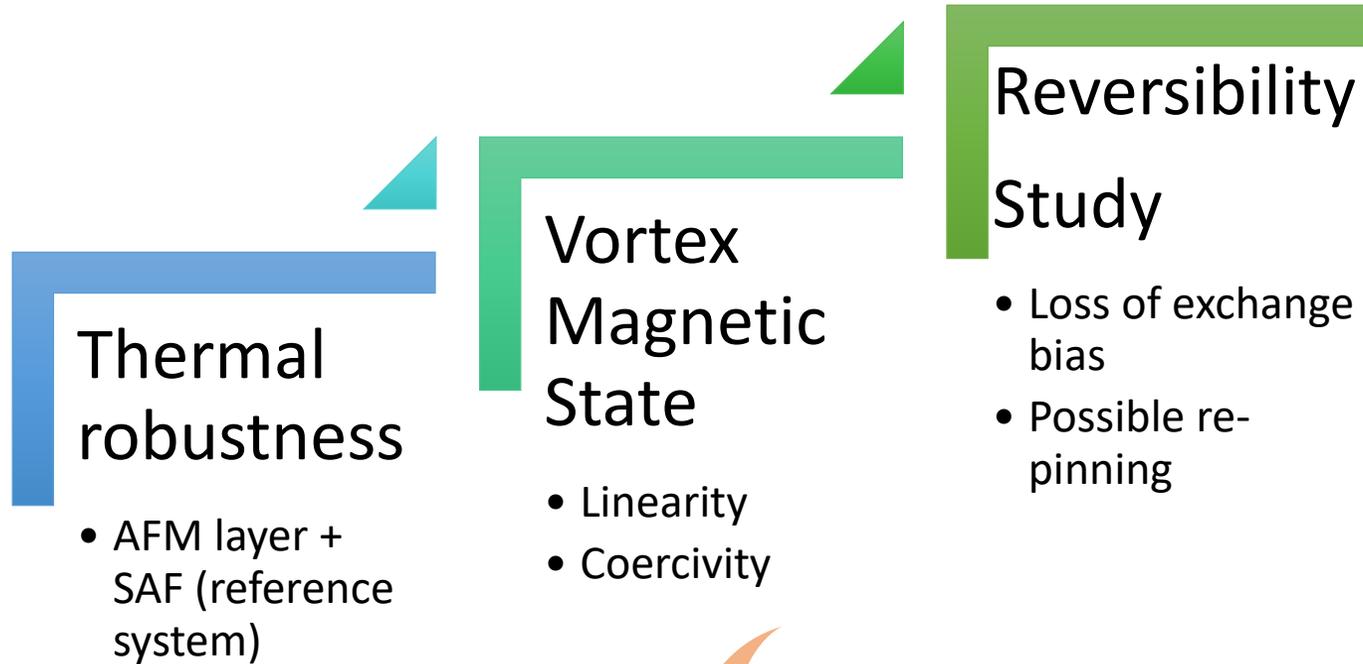

Magnetic
Vortex State

Reversibility Study: Sample 10261

Thermal tests after re-annealing

- Similar results
- Differences are within experimental uncertainty, due to sensor-to-sensor variation

Additional Samples

Improved devices

Different measurements
