Black Hole Superradiance

Action for Einstein's GR with **Maxwell electrodynamics**:

$$S = \int d^d x \left[\frac{-\sqrt{g}R}{4} - \frac{\sqrt{g}}{4} F_{AB} F^{AB} \right]. \quad (1)$$

However we will use a String-inspired modified theory: Einstein-Gauss-Bonnet gravity with **Born-Infeld** electrodynamics [Wiltshire(1988)]

$$S = \int d^d x \left[\frac{-\sqrt{g}R}{4} + \alpha \sqrt{g} \left(R_{ABCD} R^{ABCD} - 4R_{AB} R^{AB} + R^2 \right) + b^2 \left(\sqrt{g} - \sqrt{\det \left(g_{EF} + \frac{F_{EF}}{b} \right)} \right) \right]. \quad (2)$$

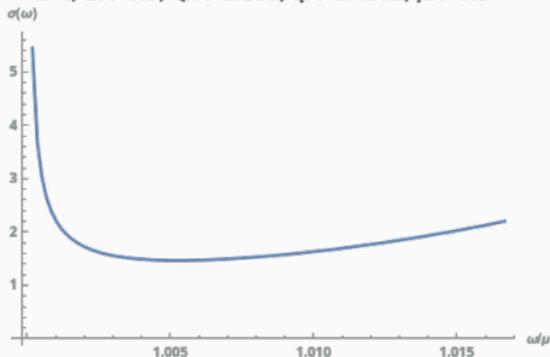

In the limit $\alpha \rightarrow 0$, $b \rightarrow +\infty$, Eq. 2 reduces to Eq. 1.

We consider a charged, spherically symmetric black hole solution from this modified theory.

Absorption Cross Section

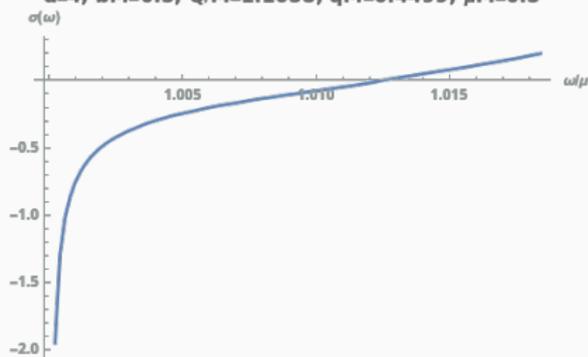

Unbounded absorption

$d=4$, $bM=0.5$, $Q/M=1.105$, $qM=0.4502$, $\mu M=0.5$

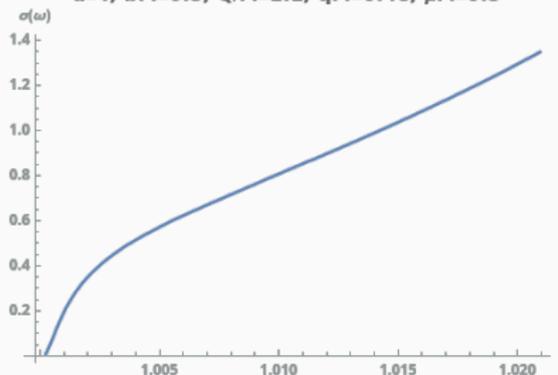

Unbounded superradiance

$d=4$, $bM=0.5$, $Q/M=1.1058$, $qM=0.4499$, $\mu M=0.5$

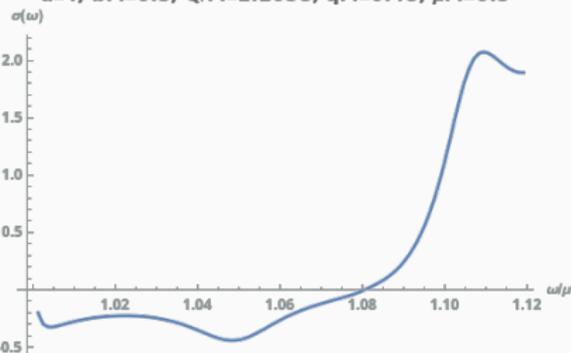

Bounded absorption

$d=4$, $bM=0.5$, $Q/M=1.1$, $qM=0.48$, $\mu M=0.5$

Bounded superradiance

$d=4$, $bM=0.5$, $Q/M=1.1058$, $qM=0.48$, $\mu M=0.5$

Parameter space in classical GR

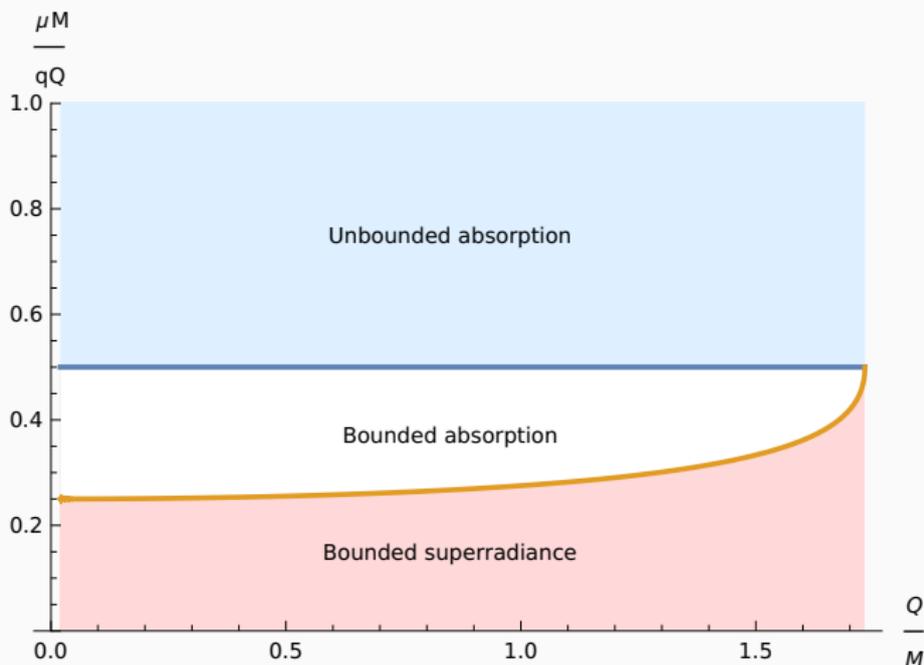

Figure 1: Parameter space for a charged, massive scalar field and a charged black hole in classical GR [de Paula et al.(2024)de Paula, Leite, Dolan, and Crispino]. In this case, no unbounded superradiant regime is found.

Parameter space in EGB+BI gravity

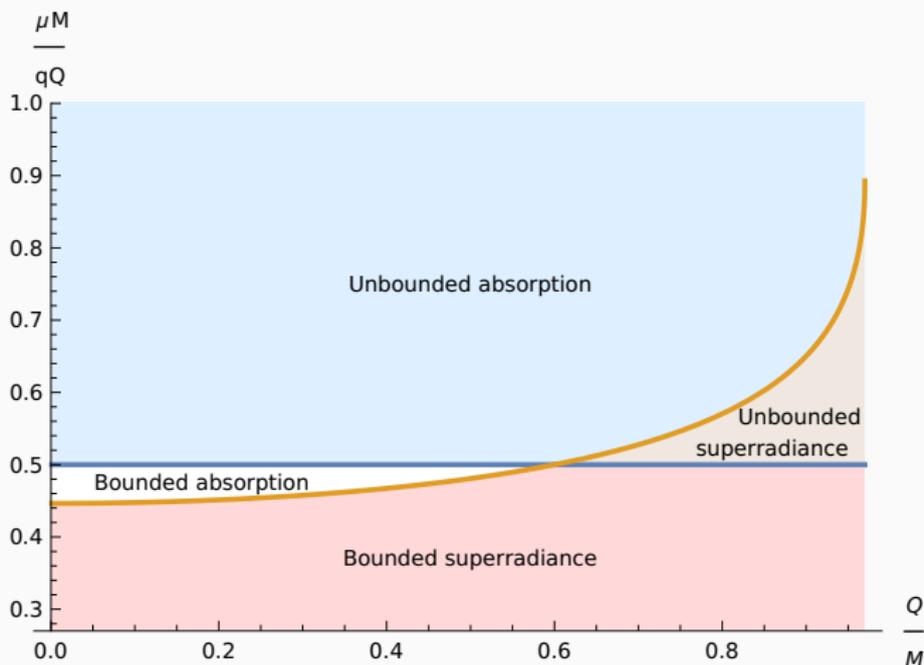

Figure 2: Parameter space for a charged, massive scalar field and a charged black hole in Einstein-Gauss-Bonnet gravity and Born-Infeld electrodynamics ($\alpha/M = 0.22$, $b\sqrt{M} = 5$).

- We have characterized the presence of **unbounded superradiance** in an **Einstein-Gauss-Bonnet black hole with Born-Infeld NED**. Modifications of gravity or of electrodynamics can both enable an unbounded superradiant regime.
- Unbounded superradiance implies the BH is acting as an **arbitrarily large wave amplifier**. Taking into account **backreaction on the metric** could be necessary to fully characterize the dynamics.
- Open questions:
 - Relation between unbounded superradiance and **superradiant instabilities**?
 - Presence of unbounded superradiance in other models/rotational superradiance?

Einstein-Gauss-Bonnet + Born-Infeld Black Hole

From our action, a spherically symmetric, charged black hole solution was found [Wiltshire(1988)], with metric given by:

$$ds^2 = -f(r)dt^2 + \frac{1}{f(r)}dr^2 + r^2 d\Omega_{d-2}^2, \quad (3)$$

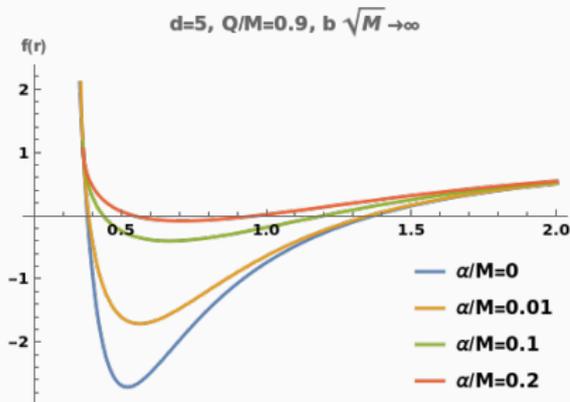

Figure 3: Metric function $f(r)$ for $b \rightarrow \infty$ and different values of α .

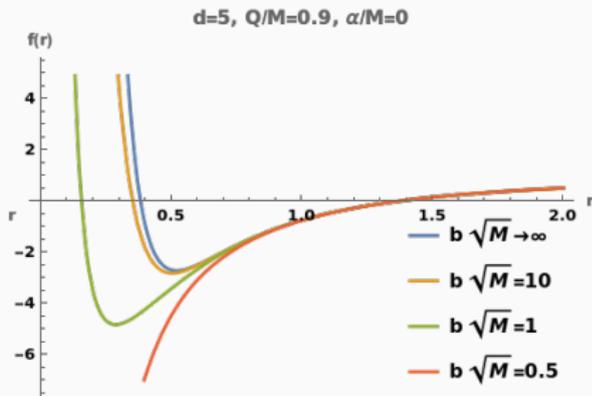

Figure 4: Metric function $f(r)$ for $\alpha = 0$ and different values of b .

Born-Infeld electrodynamics

For a point-charge Q at $r=0$, the electrostatic potential is given by

$$\Phi(r) = - \int_{\infty}^r \frac{Q}{\sqrt{Q^2/b^2 + z^{2d-4}}} dz. \quad (4)$$

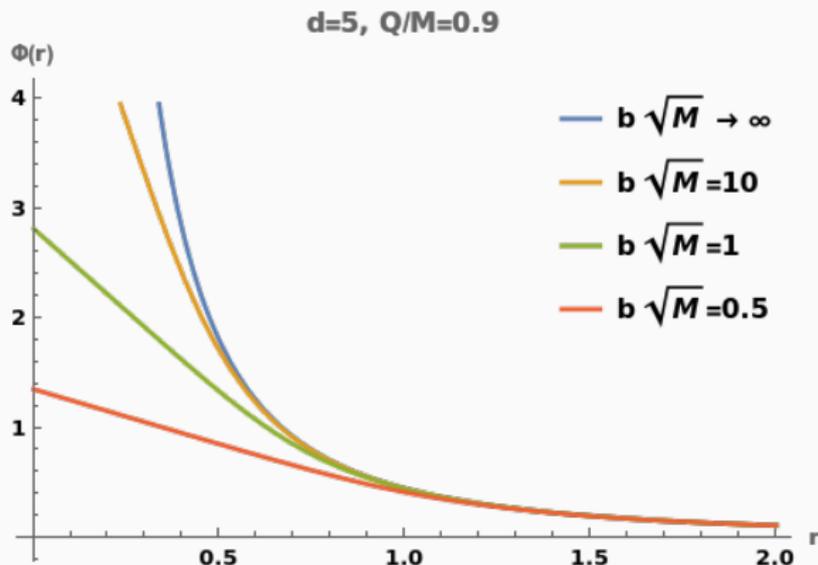

Figure 5: Electrostatic potential of a point charge for different values of b .

A spherically symmetric charged black hole is found, whose metric is given by [Wiltshire(1988)]:

$$ds^2 = -f(r)dt^2 + \frac{1}{f(r)}dr^2 + r^2 d\Omega_{d-2}^2, \quad (5)$$

$$f(r) = 1 + \frac{r^2}{8\tilde{\alpha}} \left(1 + \sqrt{1 + \frac{16\tilde{\alpha}}{r^{d-1}} (2M + U(r))} \right), \quad \tilde{\alpha} = (d-3)(d-4)\alpha, \quad (6)$$

$$U(r) = \frac{4Q}{d-1} \left(\frac{Qr^3}{(d-2) \left(r^d + \sqrt{\frac{Q^2 r^4}{b^2} + r^{2d}} \right)} + \int \frac{b^2 dr}{\sqrt{r^{2d-4} + Q^2}} \right). \quad (7)$$

Taking $\alpha \rightarrow 0$ and $b \rightarrow \infty$,

$$f(r) \rightarrow 1 - \frac{2M}{r^{d-3}} + \frac{2Q^2}{(d-3)(d-2)r^{2d-6}}. \quad (8)$$

The electrostatic potential for a point charge Q at $r=0$ yields,

$$\Phi(r) = \frac{b^2}{Q} \left(\frac{1}{\sqrt{\pi}} \left(\frac{Q}{b} \right)^{1+\frac{1}{d-2}} \Gamma \left(1 + \frac{1}{2d-4} \right) \Gamma \left(\frac{d-3}{2d-4} \right) - r \sqrt{\left(\frac{Q}{b} \right)^2 + r^{2d-4}} {}_2F_1 \left(1, \frac{d-1}{2d-4}, 1 + \frac{1}{2d-4}; -\frac{b^2 r^{2d-4}}{Q^2} \right) \right), \quad (9)$$

Taking $b \rightarrow \infty$,

$$\Phi(r) \rightarrow \frac{Q}{(d-3)r^{d-3}}. \quad (10)$$

Superradiance of a scalar field

Let us consider a scalar field with mass μ and charge q in the black hole background.

- Klein-Gordon equation $(\nabla_\nu - iqA_\nu)(\nabla^\nu - iqA^\nu)\Psi - \mu^2\Psi = 0$.
- Separation of variables. For a particular (l, m) mode:
$$\Psi = r^{-(d-2)/2} e^{-i\omega t} u_{\omega,l}(r) Y_{l,m}(\Omega) \longrightarrow \left(\frac{d^2}{dr_*^2} - V(r) \right) u_{\omega,l}(r) = 0.$$
- Boundary conditions

$$u_{\omega,l} \sim \begin{cases} T_{\omega l} e^{-i\kappa r_*}, & r_* \rightarrow -\infty \quad (r \rightarrow r_H) \\ I_{\omega l} e^{-i\tilde{\omega} r_*} + R_{\omega l} e^{i\tilde{\omega} r_*}, & r_* \rightarrow +\infty \quad (r \rightarrow +\infty) \end{cases} \quad (11)$$

where $\kappa = \lim_{r \rightarrow r_H} \sqrt{-V(r)} = \omega - q\Phi(r_H)$,

$\tilde{\omega} = \lim_{r \rightarrow \infty} \sqrt{-V(r)} = \sqrt{\omega^2 - \mu^2}$.

- Absorption cross section given by

$$\sigma(\omega) = \sum_l \sigma_l(\omega), \quad \sigma_l(\omega) = F_{d,l} \frac{1}{\tilde{\omega}^{(d-1)}} (\omega - q\Phi(r_H)) \frac{|T_{\omega l}|^2}{|I_{\omega l}|^2}. \quad (12)$$

- Superradiance occurs when $\omega < q\Phi(r_H)$: extracting electrostatic energy from the BH.

$$\left(\frac{d^2}{dr_*^2} - V_{\omega,l}(r) \right) u_{\omega,l}(r) = 0, \quad dr_* = dr/f(r). \quad (13)$$

$$V_{\omega,l}(r) = f(r) \left(\frac{(d-2)(d-4)}{4} \frac{f(r)}{r^2} + \frac{d-2}{2r} \frac{df(r)}{dr} + \frac{l(l+d-3)}{r^2} \right) - (\omega - q\Phi(r))^2. \quad (14)$$

Amplification factor:

$$Z_{\omega l} = \frac{|R_{\omega l}|^2}{|I_{\omega l}|^2} - 1 = -\frac{\omega - q\Phi(r_H)}{\kappa} \frac{|T_{\omega l}|^2}{|I_{\omega l}|^2}, \quad (15)$$

Cross section:

$$\sigma(\omega) = \sum_l \sigma_l(\omega), \quad (16)$$

$$\sigma_l(\omega) = \frac{\pi^{(d-2)/2} (l+d-4)! (2l+d-3)}{\Gamma\left(\frac{d-2}{2}\right)} \frac{1}{\kappa^{(d-1)}} (\omega - q\Phi(r_H)) \frac{|T_{\omega l}|^2}{|I_{\omega l}|^2}. \quad (17)$$

Bounded/unbounded Cross-Section

Defining $U(r) = \lim_{\omega \rightarrow \mu} V_{\omega, l=0}(r)$ and expanding in powers of $1/r$:

- $d=4$:

$$U(r) = 2\mu \frac{qQ - \mu M}{r} + \mathcal{O}(r^{-2}). \quad (18)$$

- $d=5$:

$$U(r) = \frac{3/4 + qQ\mu - 2M\mu}{r^2} + \mathcal{O}(r^{-3}). \quad (19)$$

- $d=6$:

$$U(r) = \frac{2}{r^2} + \mathcal{O}(r^{-3}). \quad (20)$$

- $d=7$:

$$U(r) = \frac{15}{r^2} + \mathcal{O}(r^{-3}). \quad (21)$$

For $d \geq 6$, there is no propagative region extending to infinity in the limit $\omega \rightarrow \mu$.

Bounded/Unbounded Cross-Section
