

Subjet observables in Heavy-Ion Collisions

João Cruz & João Silva

Introduction

- ◆ Global aim of this project (and all heavy-ion community!)
- ◆ Study the Quark-Gluon Plasma (QGP) that is created in heavy-ion collisions;
- ◆ Why? State of matter where quarks and gluons are not bound into hadrons; also, it is believed that existed at the initial stages of our Universe;

Introduction

- ◆ Global aim of this project (and all heavy-ion community!)
- ◆ Study the Quark-Gluon Plasma (QGP) that is created in heavy-ion collisions;
- ◆ Why? State of matter where quarks and gluons are not bounded into hadrons; also, it is believed that existed at the initial stages of our Universe;

Introduction

- ◆ Aim: Study the QGP!
- ◆ How?
- ◆ It has to be indirectly... we cannot observe the QGP directly because it lives for a very short time!!
- ◆ We use jets! Several tools at our disposition: theoretical (perturbative QCD) and phenomenological (Monte Carlo Event Generators).

Introduction

- ◆ Aim: Study the QGP!
- ◆ How? Jets!
- ◆ Problem: observations are based on the result of the jet development inside the expanding QGP;
- ◆ Our BIG challenge: Create new ways of using jets in heavy-ions to assess QGP properties, namely its initial timescales;
- ◆ But for that, starting by something simple...
- ◆ Jet development in vacuum!

Jets in “vacuum”

- ◆ Starting by the basics:
- ◆ In a proton-proton collision, we have two particles that scatter;
- ◆ This scattering happens at a very large energy scale and produces two new particles back-to-back;
- ◆ Each of those will split into two, and these processes add to form what we define as a jet.

Jets in “vacuum”

- ◆ Starting by the basics:
- ◆ In a proton-proton collision, we have two particles that scatter;
- ◆ This scattering happens at a very large energy scale and produces two new particles back-to-back;
- ◆ Each of those will split into two, and these processes add to form what we define as a jet.

Jets in “vacuum”

- ◆ Starting by the basics:
- ◆ In a proton-proton collision, we have two particles that scatter;
- ◆ This scattering happens at a very large energy scale and produces two new particles back-to-back;
- ◆ Each of those will split into two, and these processes add to form what we define as a jet.

Our Working Setup

- ◆ To study what exactly is a jet, we used Pythia8 Monte Carlo event generator tuned for:
 - ◆ Hard QCD processes (dijets)
 - ◆ $\sqrt{s}_{\text{cm}} = 5.02 \text{ TeV}$ (current PbPb collisions)
- ◆ $|\eta_{\text{jet}}| < 2.5, p_{\text{T,Hat}} \in [50, \infty[$
- ◆ And Fastjet package to reconstruct jets with the following settings:
 - ◆ Anti- k_{T} algorithm
 - ◆ $R = 0.2 \dots 1.0$

Our Working Setup

- ◆ To study what exactly is a jet, we used Pythia8 Monte Carlo event generator tuned for:
- ◆ Hard QCD processes (dijets)
- ◆ $\sqrt{s}_{\text{cm}} = 5.02 \text{ TeV}$ (current PbPb collisions)
- ◆ $|\eta_{\text{jet}}| < 2.5$, $p_{\text{T,Hat}} \in [50, \infty[$
- ◆ And Fastjet package to reconstruct jets with the following settings:
 - ◆ Anti- k_{T} algorithm
 - ◆ $R = 0.2 \dots 1.0$

The idea is to go back in the pythia event record to track all the jet history (mainly the number of splittings and its fraction of energy)

Jet first splitting

- ◆ Our first study: starting by the first splitting...
- ◆ Typically asymmetric, as predicted by pQCD

Energy Fraction on First Split vs Jet pT

Direct sum of QCD splitting functions

Jet first splitting

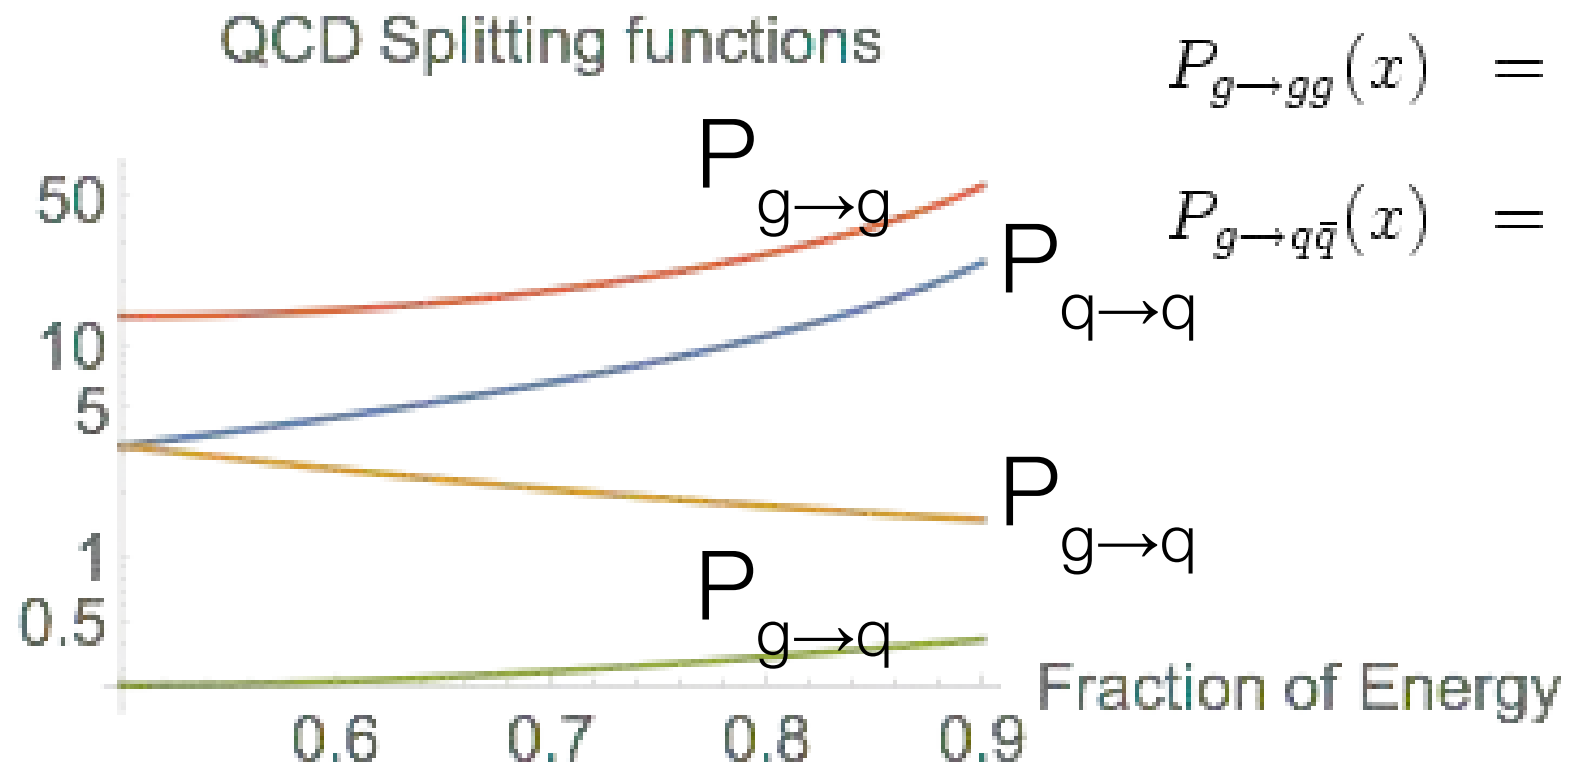

- ◆ Our first study: starting by the first splitting...
- ◆ Gluon splitting functions dominate over Quark splitting functions

$$P_{q \rightarrow qg}(x) = P_{\bar{q} \rightarrow \bar{q}g}(x) = C_F \frac{1+x^2}{1-x},$$

$$P_{q \rightarrow gq}(x) = P_{q \rightarrow qg}(1-x) = C_F \frac{1+(1-x)^2}{x},$$

$$P_{g \rightarrow gg}(x) = 2C_A \left[\frac{x}{1-x} + \frac{1-x}{x} + x(1-x) \right],$$

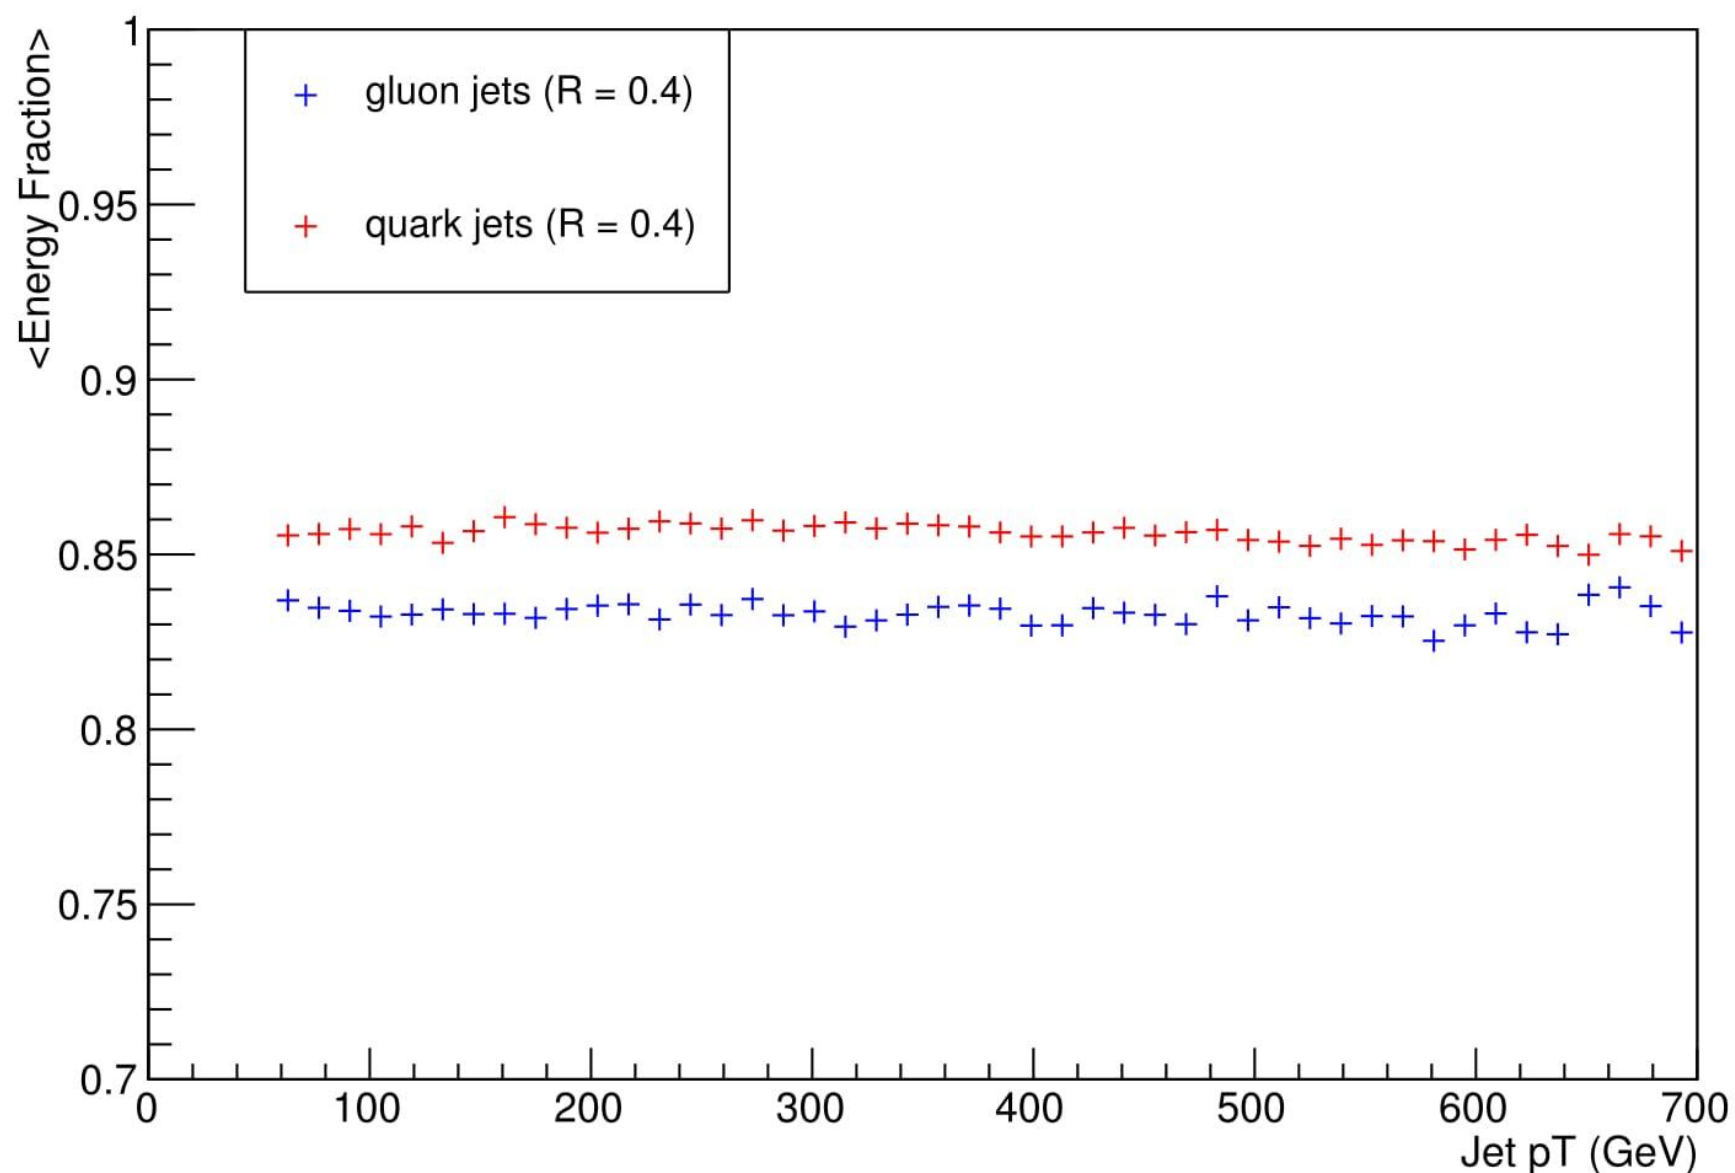

$$P_{g \rightarrow q\bar{q}}(x) = T_R [x^2 + (1-x)^2],$$

Jet first splitting

- ♦ Tagging each event's leading jet original particle, one can accumulate enough statistics to confirm the result of both the quarks and gluons splitting functions.

Energy Fraction on First Split vs Jet pT

Total Number of splittings

- ◆ How many splits does a jet contain, on average?
- ◆ clearly this controls fragmentation of jet
- ◆ more splits means less jet energy inside of the jet radius

Leading Jet

Subleading Jet

Number of Splits vs Jet pT

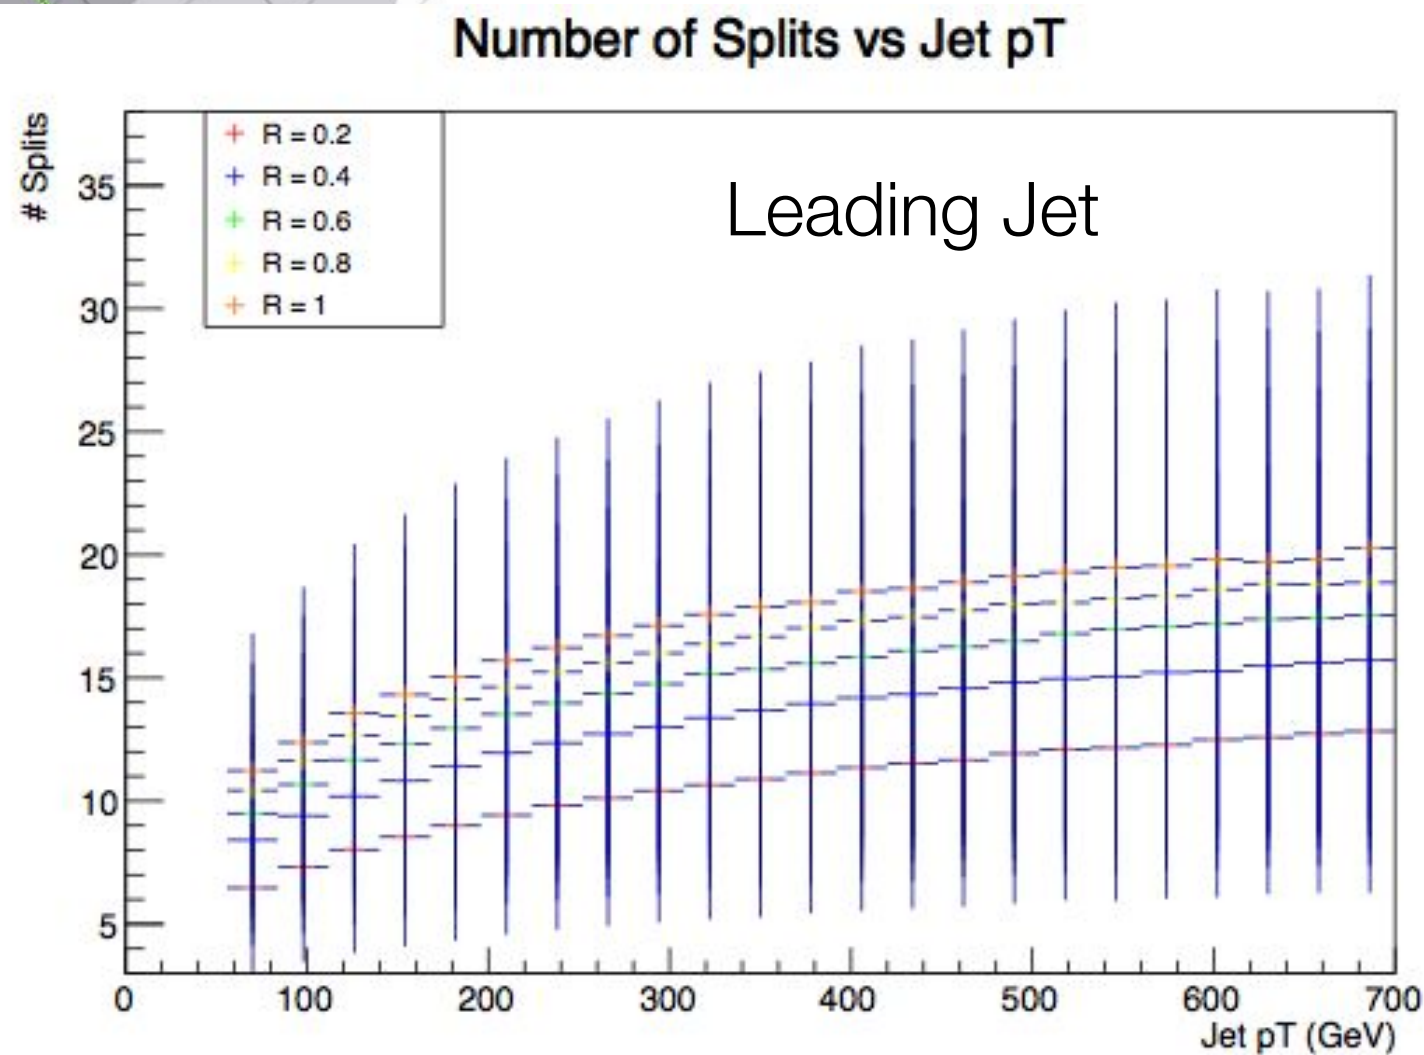

Number of Splits vs Jet pT

Total Number of splittings

- ◆ How does this behavior varies with the jet radius?

Splits vs Jet R

- ◆ How does the number of splittings evolve with the distance to the jet core?
- ◆ We fixed a given pt bin (400 GeV) and checked the number of total splittings as a function of the jet radius
- ◆ QCD energy spectrum goes as follows: k_T is the transverse momentum of the emitted particle with respect to the mother (so, similar info to jet R)

$$\omega \frac{dI}{d\omega dk_{\perp}^2} \sim \alpha_s \frac{1}{k_T^2} \Rightarrow \omega \frac{dI}{d\omega} \sim \alpha_s \log(k_T)$$

Number of Splits vs Radius (pT = 400 GeV)

Number of Splits vs Radius (pT = 400 GeV)

Splits vs Jet R

- ◆ The theoretical hint urged us to fit the following function to the previous data.

$$f(x) = a + b \log(x)$$

Number of Splits vs Radius (pT = 400 GeV)

Number of Splits vs Radius (pT = 400 GeV)

Splits vs Energy fraction

- ◆ Number of splits as a function of the energy fraction of the first splitting.

Very asymmetric first splitting means that one of the subjects is “killed”

Number of Splits vs Energy Fraction on First Split

Splits vs Energy fraction

- ◆ Number of splits as a function of the energy fraction of the first splitting.

Very asymmetric first splitting means that one of the subjects is “killed”

Number of Splits vs Energy Fraction on First Split

Conclusions

- ◆ Basic jet characteristics were investigated to relate to jet evolution
- ◆ Total number of splittings, energy fraction of the first splitting, correlation between the two;
- ◆ Quark vs gluon initiated jets
- ◆ Leading vs subleading

Conclusions

- ◆ Basic jet characteristics were investigated to relate to jet evolution
- ◆ Total number of splittings, energy fraction of the first splitting, correlation between the two;
- ◆ Quark vs gluon initiated jets
- ◆ Leading vs subleading
- ◆ What have we learned?
 - ◆ We didn't know 95% of this topic!

Conclusions

- ◆ Basic jet characteristics were investigated to relate to jet evolution
- ◆ Total number of splittings, energy fraction of the first splitting, correlation between the two;
- ◆ Quark vs gluon initiated jets
- ◆ Leading vs subleading
- ◆ What have we learned?
 - ◆ We didn't know 95% of this topic!
 - ◆ Now we don't know only 90% :-)

Prospects

- ◆ What would be the next steps:
- ◆ Relate this results with the in-medium jet development;
- ◆ Create a space-time picture of a jet to better assess QGP density evolution profile.

The background features a light gray grid. Overlaid on this are several thin, curved purple lines that sweep across the frame. In the upper-left and lower-left corners, there are clusters of 3D yellow cubes of varying sizes and orientations, some appearing to be part of a larger structure.

João Cruz and João Silva

Total Number of Splittings

- ◆ How many splits does a jet contain, on average? How does it change with the jet transverse momentum?
- ◆ Large dispersion on the total number of splittings.

Number of Splits vs Jet pT

Total Number of splittings

◆ Leading vs subleading

◆ more splits means less jet energy inside of the jet radius

Leading Jet

Subleading Jet

Number of Splits vs Jet pT

Number of Splits vs Jet pT

Total Number of splittings

- ◆ How universal is this quantity's evolution with respect to the jet pT?
- ◆ Leading and subleading behave very differently.

Leading Jet

Number of Splits vs Jet pT

Subleading Jet

Number of Splits vs Jet pT

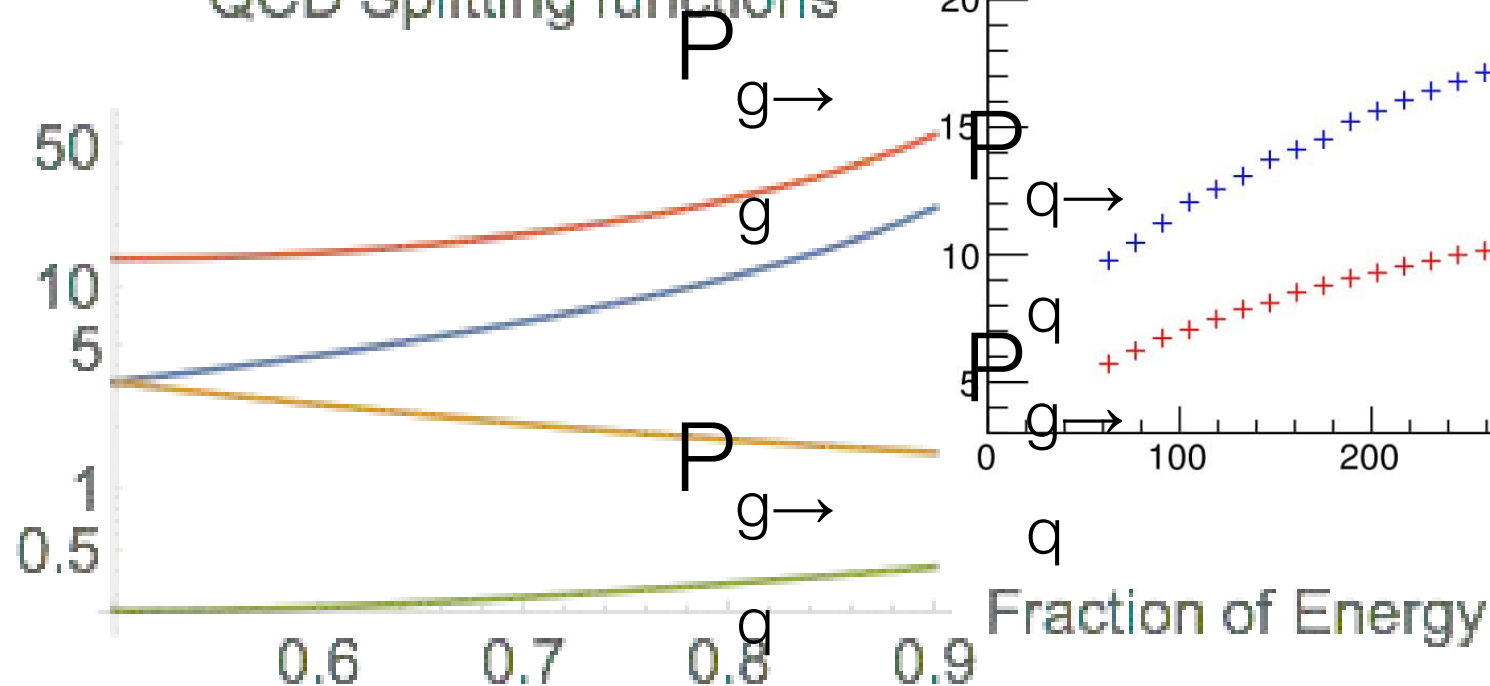

Total Number of splittings

- Again tagging quark and gluon initiated jets, gluon jets show a higher number of splittings.

Number of Splits vs Jet pT

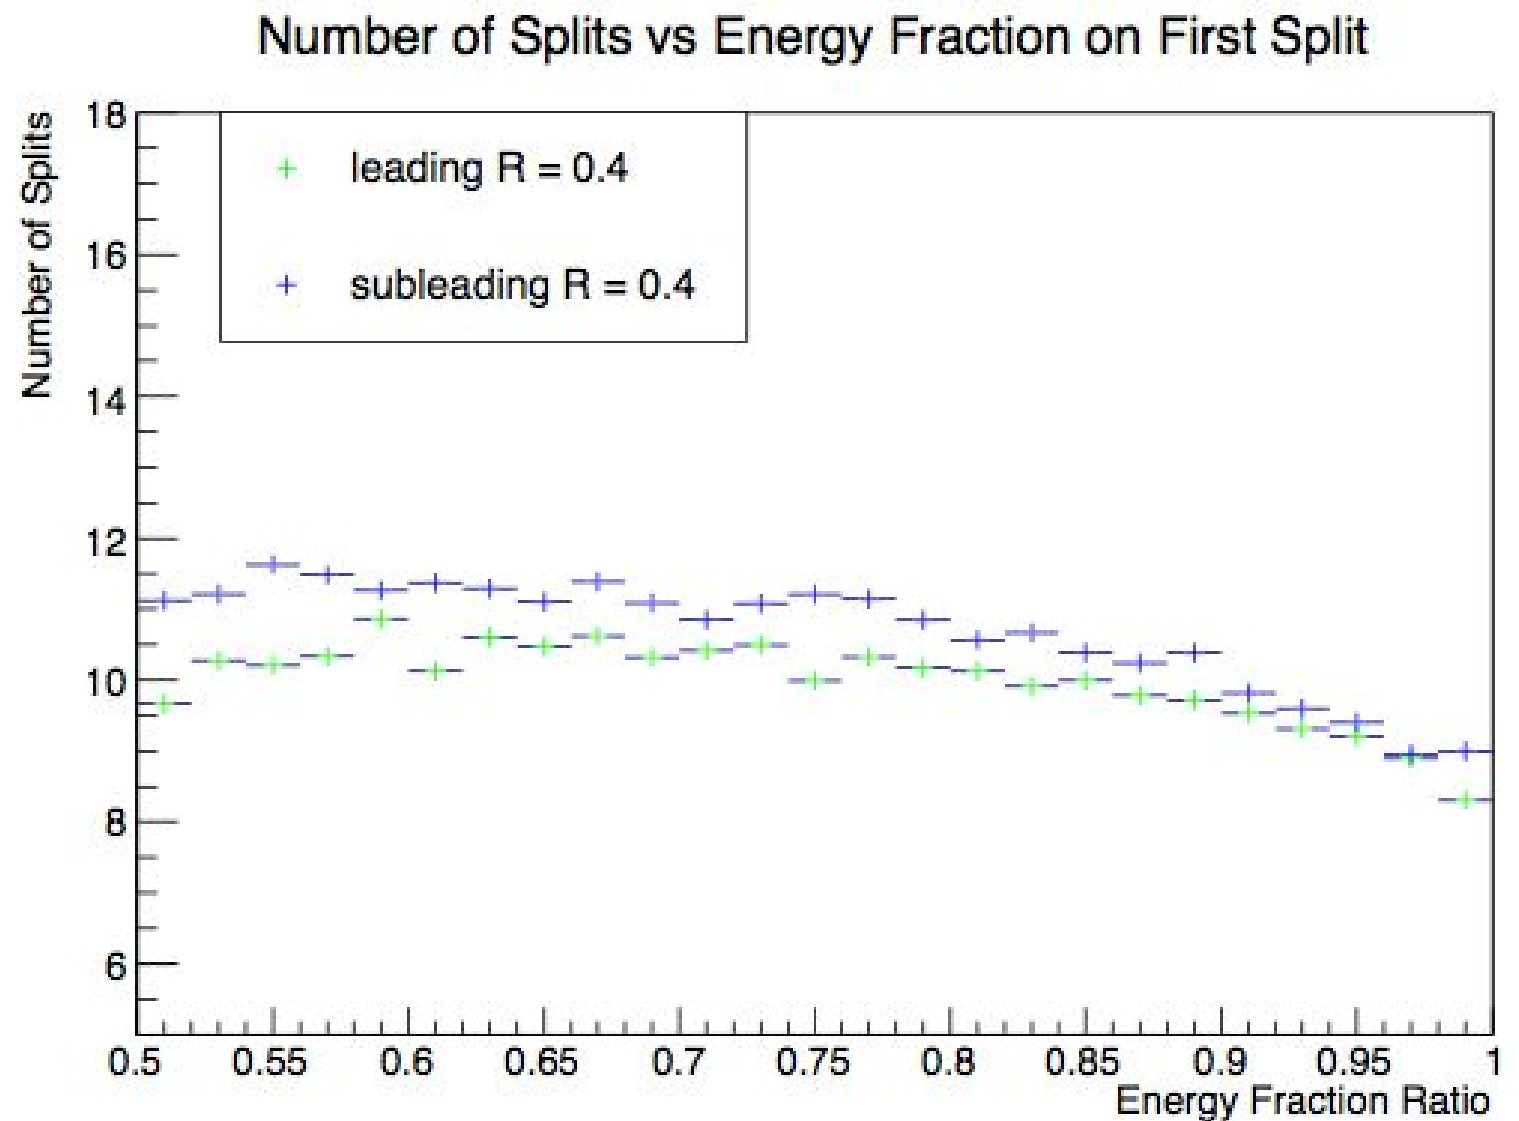

QCD Splitting functions

Splits vs Energy fraction

- ◆ Number of splits as a function of the energy fraction of the first splitting.
- ◆ Very asymmetric first splitting means that one of the subjects is “killed”
- ◆ Same trend is found for both leading and subleading

A decorative graphic on the left side of the slide shows a grey, cone-like shape representing a jet, with several green lines radiating from its tip, illustrating the fragmentation pattern of a jet.

Conclusions

- ◆ What have we learned from this work?
- ◆ How a jet develops, on average, in vacuum, taking into account very general features such:
 - ◆ How many times does it splits; How this quantity can be related to the jet energy and to the jet fragmentation pattern (leading or subleading)
 - ◆ How the first splitting controls the jet development;
 - ◆ How we can recover the number of splitting when increasing the jet radius (direct link also to the jet energy - next question would be how is the energy recovered with the jet radius)
 - ◆ How quark and gluon initiated jets can be different
