MUON TOMOGRAPHY

OVERVIEW

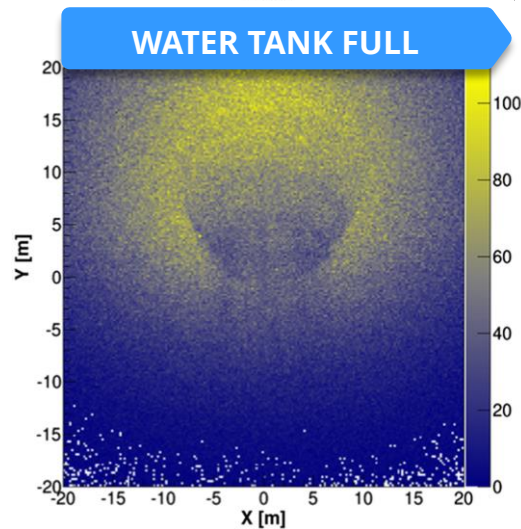

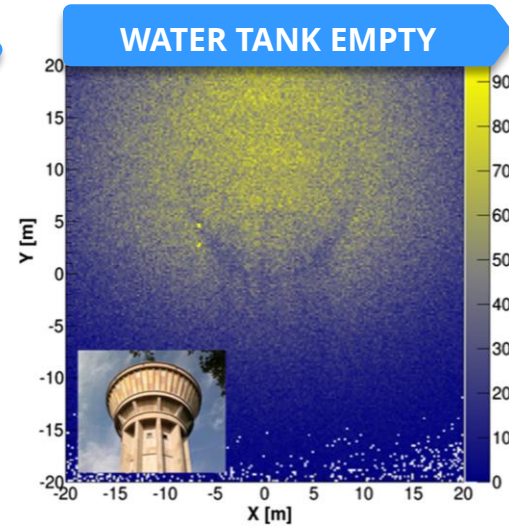

MUON TOMOGRAPHY

MUON TRANSMISSION

MUOGRAPHY OF A WATER TOWER (FRANCE)

- 4 days of exposure for each image
- density differences observed

MUON SCATTERING

PORTAL SCANNER (BAHAMAS)

- trafficking surveillance of high dense materials (eg. radioactive)
- in this case, the inspection takes less than 5 min

PROTOTYPE

OBJECTIVE: to do a geological reconnaissance of the ground above the mine to test the performance and the sensitivity of the telescopes.

- Part of the work is about developing simulations in GEANT4, so we can have references when we analyse the muography data.

A detailed description of the topology is necessary to compare the observed information with the expected results.

GPR – GROUND PENETRATING RADAR

GPR ANTENNA

- It measures the electrical resistivity of the materials.

GPR PROFILE (EXAMPLE FROM OTHER WORK)

SEISMIC REFRACTION

SEISMIC SENSORS

- It measures the speed propagation of the seismic waves.

STANDARD TECHNIQUES

MUOGRAPHY

$$\phi \propto \frac{1}{\rho}$$

$$g \propto \rho$$

MUOGRAPHY

obtains the density through the attenuation of the muon flux

GRAVIMETRY

obtains the density through the strength of the gravitational field
