

Introduction to Geant4

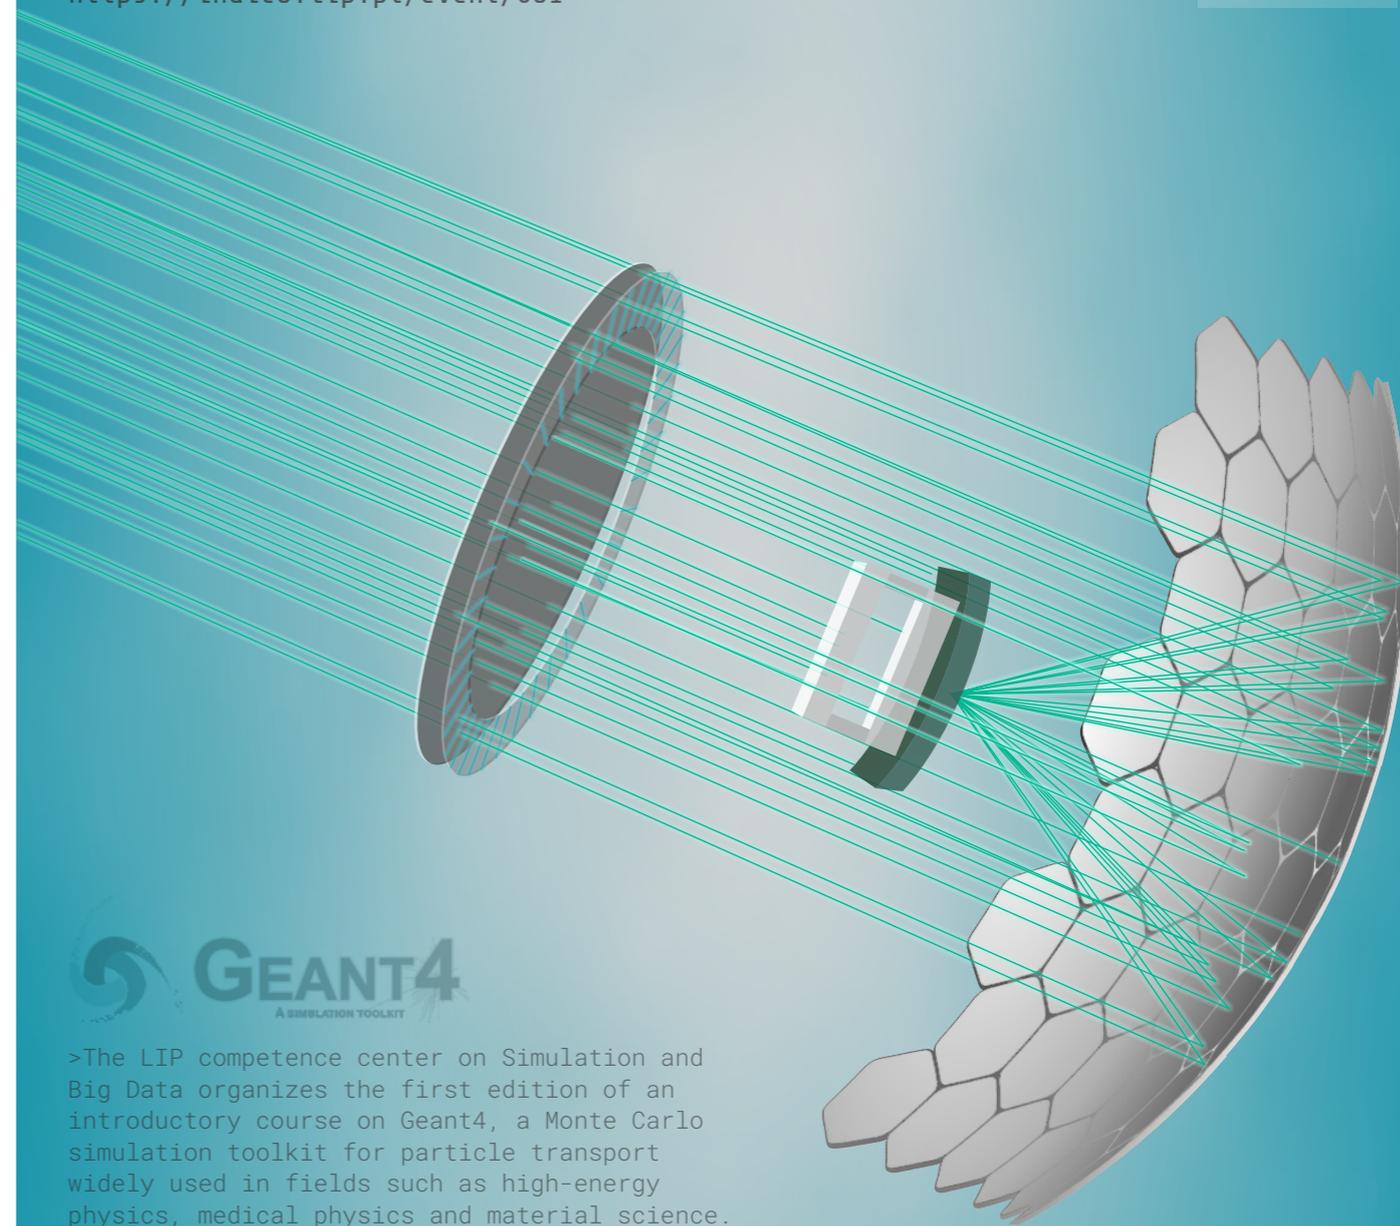

CF-UM-UP

INTRODUCTORY COURSE ON
GEANT4

11-13 February 2020
University of Minho
Gualtar Campus, Braga
<https://indico.lip.pt/event/681>

>The LIP competence center on Simulation and Big Data organizes the first edition of an introductory course on Geant4, a Monte Carlo simulation toolkit for particle transport widely used in fields such as high-energy physics, medical physics and material science.

Organizing committee:

N. Castro, P. Gonçalves, A. Lindote, R. Sarmiento, B. Tomé, M. Vasilevskiy

Geant4

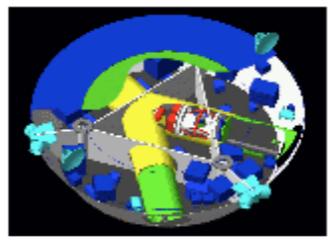

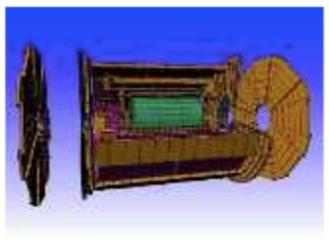

- Particle Transport Monte Carlo simulation toolkit
- Developed at CERN
- Open source C++ framework
- **GEometry ANd Tracking, version 4**

Overview

Geant4 is a toolkit for the simulation of the passage of particles through matter. Its areas of application include high energy, nuclear and accelerator physics, as well as studies in medical and space science. The three main reference papers for Geant4 are published in Nuclear Instruments and Methods in Physics Research *A 506 (2003) 250-303*, IEEE Transactions on Nuclear Science *53 No. 1 (2006) 270-278* and Nuclear Instruments and Methods in Physics Research *A 835 (2016) 186-225*.

Applications	User Support	Publications	Collaboration

News

- 29 Jun 2018
Release 10.5-BETA is available from the [BETA Download](#) area.
- 25 May 2018
Patch-02 to release 10.4 is available from the [Download](#) area.
- 12 Mar 2018
[2018 planned developments](#)
- 20 Oct 2017
Patch-03 to release 10.3 is available from the [source archive](#) area.

Selected example: particle physics

- A simulation of the fluorescence detectors of the Pierre Auger Observatory using Geant4

Proceedings of the 31st ICRC, Lodz, 2009

- Studies to estimate the light detection efficiency, necessary to evaluate the “source” energy
- Complex geometry (e.g. spot due to the camera, sensitivity to individual PMT position)

Selected example: medical physics

- Geant4 Monte Carlo simulation of absorbed dose and radiolysis yields enhancement from a gold nanoparticle under MeV proton irradiation

NIM B, 373 (2016) 126-139

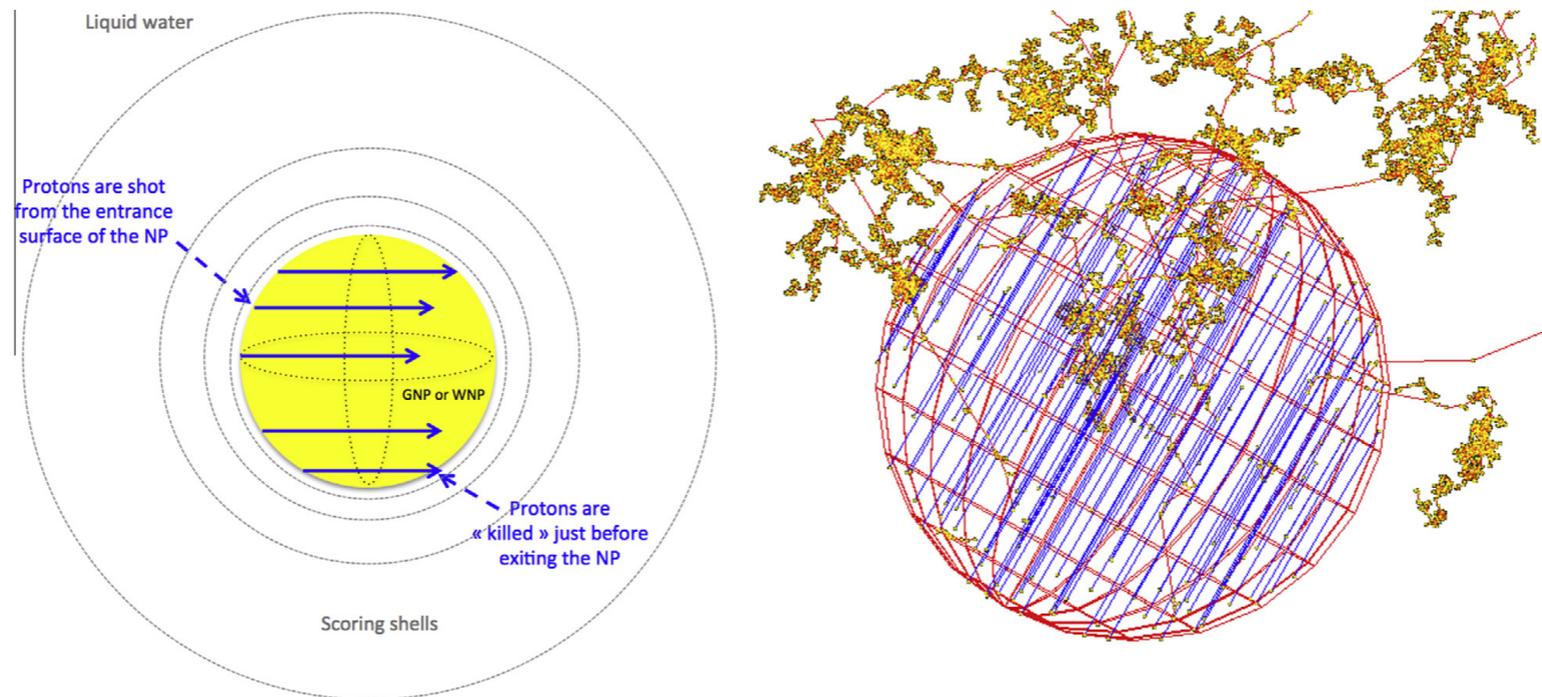

Fig. 1. Left: Schematic diagram of the simulated geometry showing the incident parallel protons (full line) inside the NP (yellow sphere) and the scoring concentric spherical shells. Right: example of visualization obtained with Geant4 when the NP (in red) is irradiated with a parallel proton beam (blue tracks), showing emitted secondary electron interactions (red tracks and yellow vertices). (For interpretation of the references to color in this figure legend, the reader is referred to the web version of this article.)

Monte Carlo

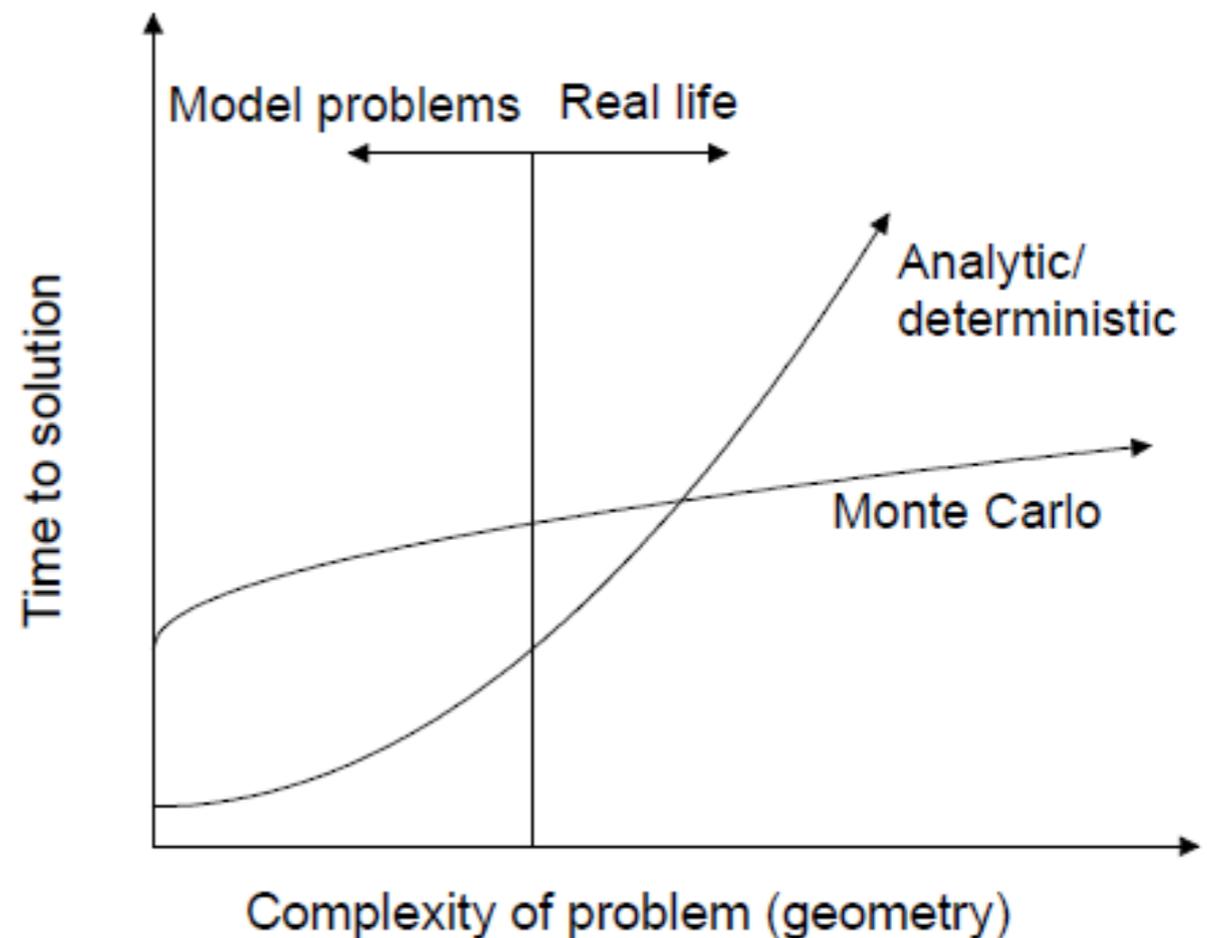

- Simple example: tracking gamma rays in a scintillator detector with a simple shape and determining the deposited energy spectrum
- The **physics is known** from first principles (photon interactions: photoelectric effect, Compton scattering, optical processes, etc)
- A complete analytical treatment of the problem is **nearly impossible**

Monte Carlo

- When the analytical calculation from physics law is unpractical, due to:
 - complicated experimental geometries
 - multiple physics processes, variables involved

Monte Carlo techniques are used to predict the outcome

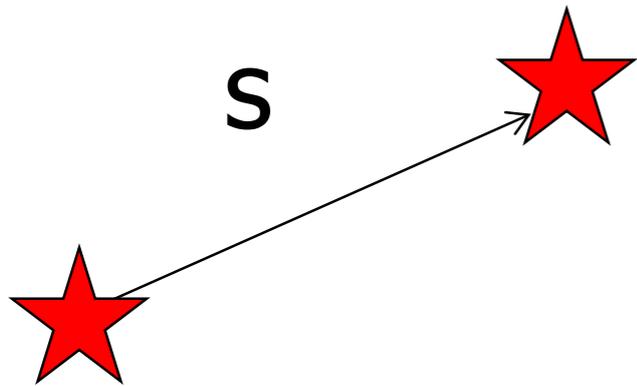

- Particle transport MC or tracking in Geant4

Tracking

- Distance s between two subsequent interactions distributed as

$$p(s) = \mu e^{-\mu s}$$

- μ is a property of the medium (homogeneous) and of the physics
- μ is proportional to the **total cross section** and depends on the **density** of the material

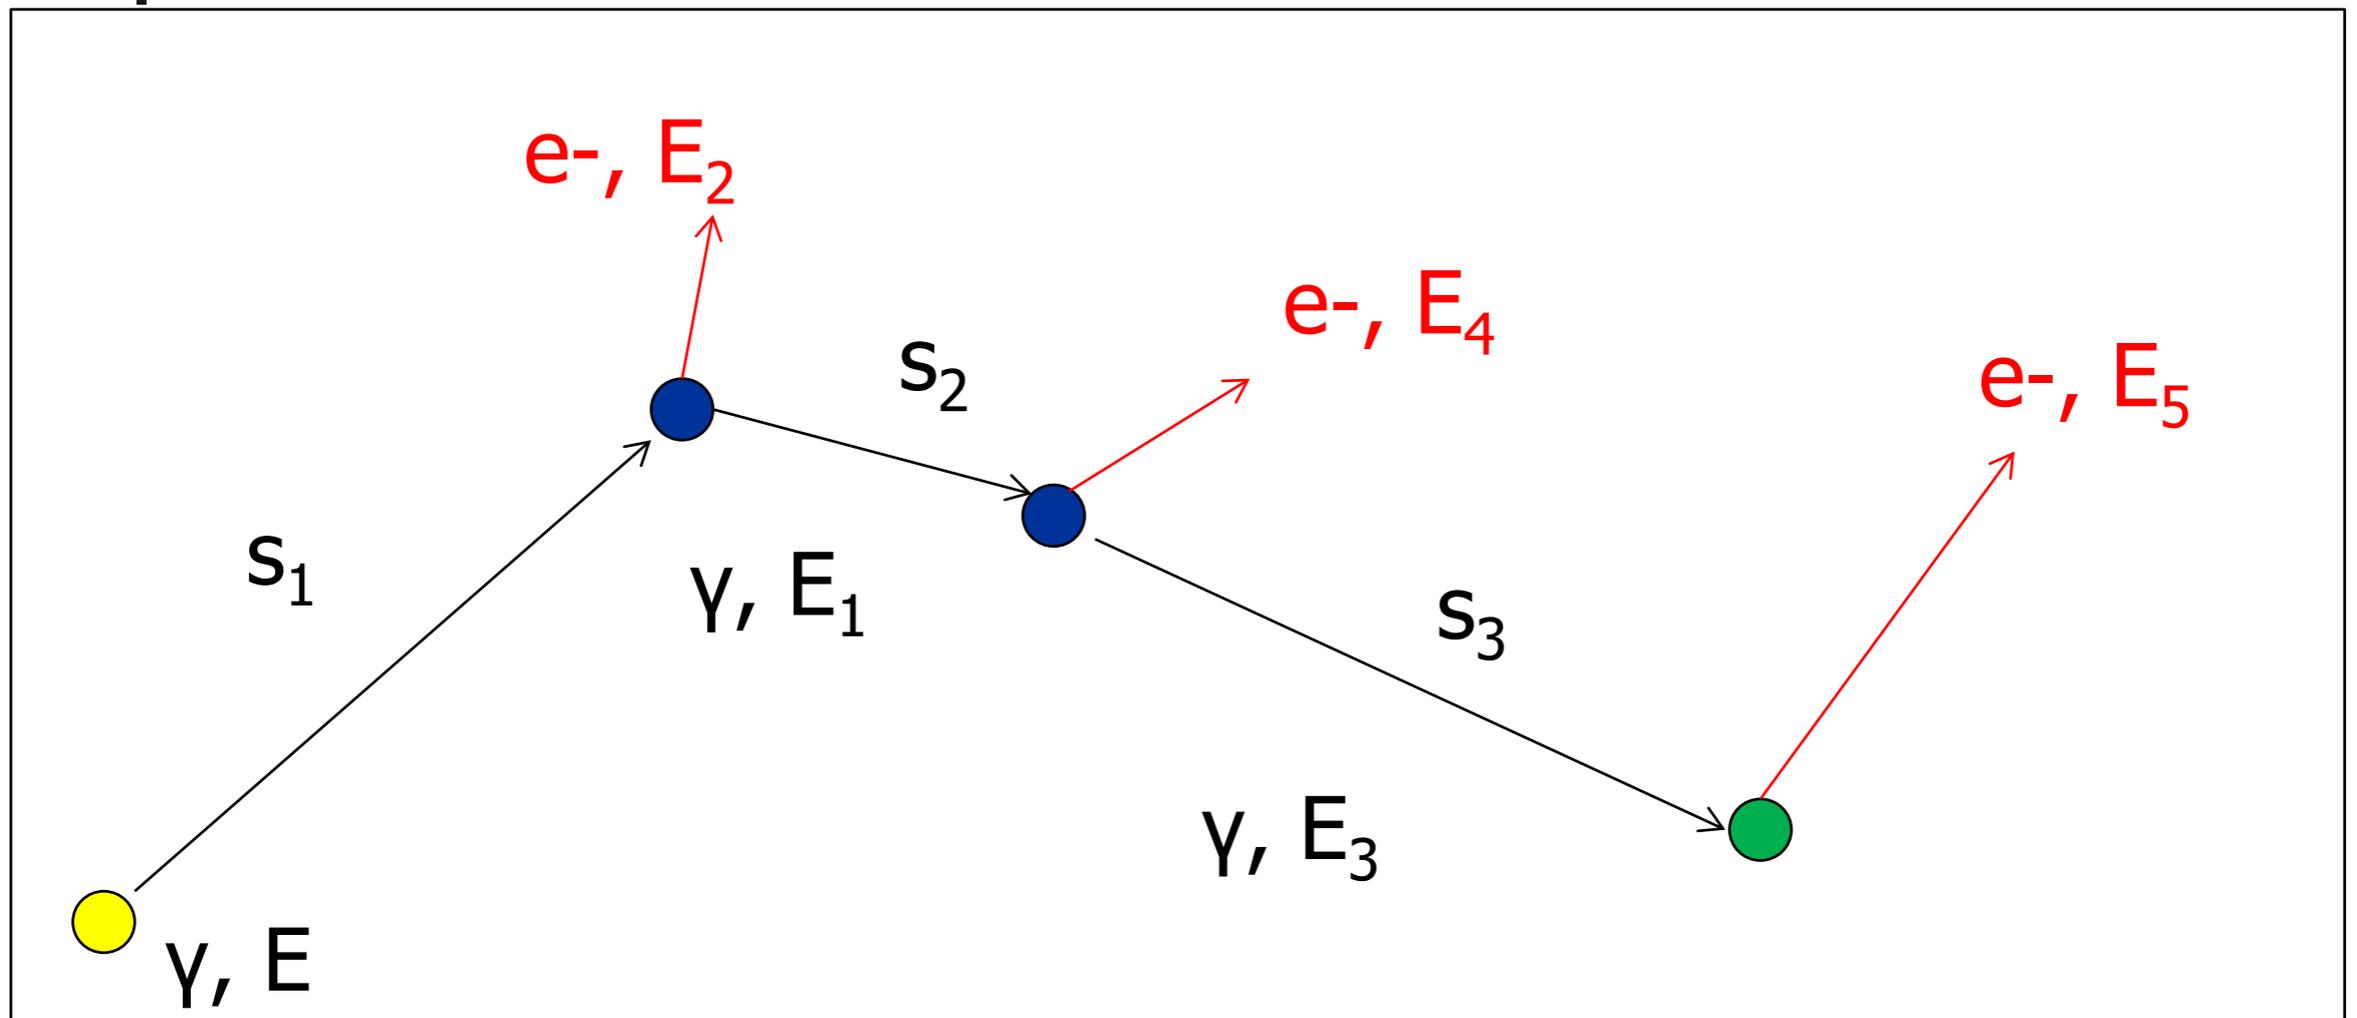

$$\mu = N\sigma = N \sum_i \sigma_i = \sum_i \mu_i$$

- All competing processes contribute with their own μ_i
- Each process takes place with probability $\mu_i/\mu \rightarrow$ i.e. proportionally to the **partial cross sections**

Tracking

- **Divide** the trajectory of the particle in "**steps**"
 - **Straight free-flight tracks** between consecutive physics interactions
 - Steps can also be **limited** by **geometry boundaries**
- Decide the **step length** s , by **sampling** according to $p(s) = \mu e^{-\mu s}$, with the **proper** μ (material+physics)
- Decide **which interaction** takes place at the end of the step, according to μ_i/μ
- Produce the **final state** according to the **physics** of the interaction ($d^2\sigma/d\Omega dE$)
 - Update **direction** of the primary particle
 - **Store** somewhere the possible **secondary particles**, to be tracked later on

Tracking

Tracking

- This basic recipe works fine for γ -rays and other **neutral** particles (e.g. neutrons)
- Not so well for e^\pm : the **cross section** (ionization & bremsstrahlung) **is very high**, so the steps between two consecutive interactions are very small
- Simulate **explicitly** (i.e. force step) interactions **only if** energy loss (or change of direction) is **above threshold W_0**
 - **Detailed** simulation
 - **"hard"** interaction (like γ interactions)
- The effect of **all sub-threshold interactions** is described **statistically** (= cumulatively)
 - **Condensed** simulation
 - **"soft"** interactions

Tracking in Geant4

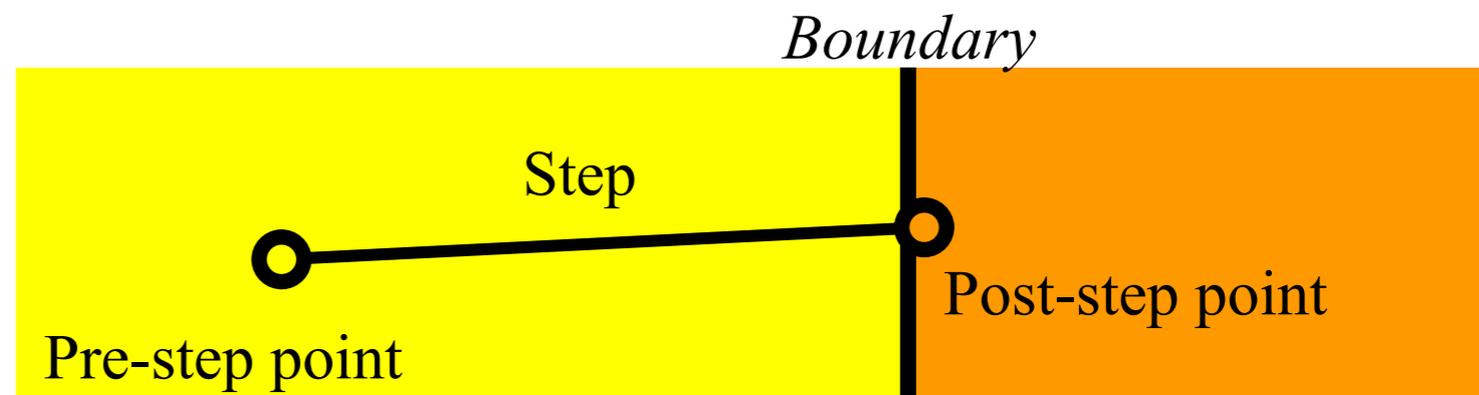

- **Particle** transportation in Geant4, **step by step**, takes into account all possible interaction **processes** with **materials** and fields
- Refined algorithm to take into account geometric boundaries, decays, etc
- **Track ends** when particle:
 - leaves the **simulation world volume**
 - disappears in an interaction
 - kinetic energy goes to zero (and no **AtRest** process)
 - is (artificially) killed

More concepts

- An **event** is the basic unit of simulation
 - begins with generation of a primary, whose track is pushed to the **stack**
 - secondary tracks are also stacked
 - each track from the stack is followed at a time
 - ends when the stack is empty
- A **run** is an event loop
 - geometry and physics are fixed at the onset
 - starts with **beamOn**

More concepts

Information may be accessed at many levels in the simulation (step, track, etc)

- **Step point**

- knows the volume where it sits
- if no interaction, is limited by a volume boundary

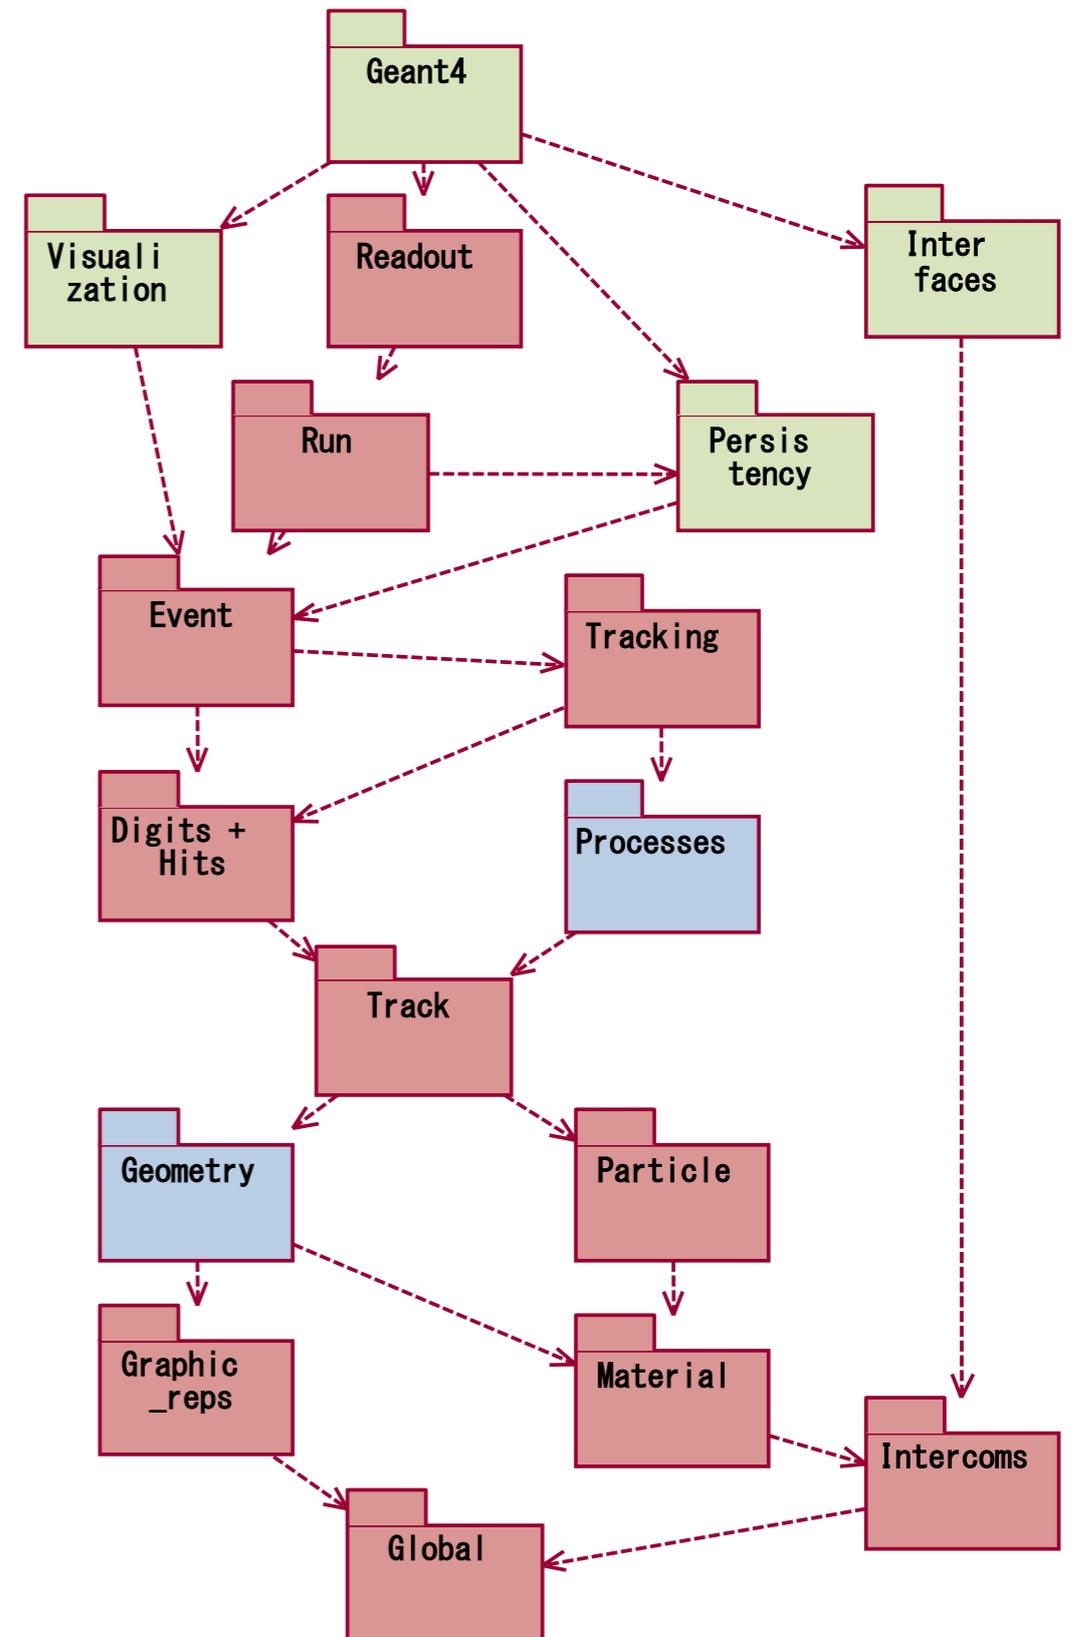

- **A process** may occur:

- at rest (e.g. decay from rest)
- along step (continuous energy loss)
- post step (decay on the fly)

Geant4 kernel

Geant4 is structured in 17 independent categories:

- Geometry and materials
- Track, event, run
- Physics processes (cross sections, final states)
- Auxiliary parts (user interface, visualization)

Build an application

- Geant4 is a **toolkit**: you must build an application, choosing its tools and following a few rules
- **Must do:**
 - describe the experimental setup materials and geometry
 - select particles and physics models (processes, thresholds) you want to use
 - define the generation of primary particles
- **May also:**
 - control your simulation via interaction with the kernel
 - set visualization
 - extract useful information

Build an application

- **Initialization classes** (invoked at initialization):

- G4VUserDetectorConstruction
- G4VUserPhysicsList

- **Action classes** (invoked during an event loop):

- G4VUserPrimaryGeneratorAction
- G4UserRunAction
- G4UserEventAction
- G4UserStackingAction
- G4UserTrackingAction
- G4UserSteppingAction

Mandatory
classes

Optional
classes

main()

- Geant4 does not provide `main()`, you have to create it as part of your application
- In `main()` **you must**:
 - Construct `G4RunManager`
 - Set user mandatory classes to RunManager with `G4RunManager::SetUserInitialization()` and `G4RunManager::SetUserAction()`
 - Optionally, set user action classes and visualization (by default, Geant4 does not take care of retrieving the relevant information)
 - Initialize the Geant4 kernel and start a run
 - At the end, delete RunManager

main() example

```
//  
// -----  
//      GEANT 4 simulation of a water tank Cherenkov detector  
// -----  
//  
#include "TankG4SimDetectorConstruction.hh"  
#include "TankG4SimPrimaryGeneratorAction.hh"  
#include "TankG4SimPhysicsList.hh"  
  
#include "G4RunManager.hh"  
  
int main(int argc, char** argv) {  
  
    // Run manager  
    G4RunManager * runManager = new G4RunManager;  
  
    // Mandatory User Initialization classes  
    runManager->SetUserInitialization(new TankG4SimDetectorConstruction);  
    runManager->SetUserInitialization(new TankG4SimPhysicsList);  
  
    // Mandatory User Action classes  
    TankG4SimPrimaryGeneratorAction* PrimGenAct = new TankG4SimPrimaryGeneratorAction();  
    runManager->SetUserAction(PrimGenAct);  
  
    //Initialize G4 kernel  
    runManager->Initialize();  
  
    // Start a run  
    G4int numberOfEvents = 1 ;  
    runManager->BeamOn(numberOfEvents);  
  
    delete runManager;  
  
    return EXIT_SUCCESS;  
}
```

Questions?

Hands-On Session #1

Fetch and analyze the code
Compile and run
Basic user interface

Fetch the code

- Instructions for using git:

https://git02.ncg.ingrid.pt/raul/LIP_Geant4_Course_Braga_2020/wikis/Using-Git-to-access-the-repository

- Fetch the code from the remote repository:

```
git clone https://git02.ncg.ingrid.pt/raul/LIP_Geant4_Course_Braga_2020.git
```

- Alternatively, just download it directly from the webpage

Analyze the code

- Go to [HandsOn/Spectroscopy](#)
- Check the code structure for:
 - header files
 - source files
 - application file with main()
 - macros

Compile and run

- Compile with make

- uses the **GNUmakefile**
- run the following commands:

```
source ~/Applications/geant4.10.04.p02-install/share/Geant4-10.4.2/geant4make/geant4make.sh  
make
```

- (or) Compile with cmake

- uses the **CMakeLists.txt**
- run the following commands:

```
mkdir build  
cd build  
cmake -DCMAKE_PREFIX_PATH==~/Applications/geant4.10.04.p02-install/ ../.  
make
```

your geant4-install path

- Run the executable

```
executable_command  
(or) ./name_of_the_executable
```

Basic user interface

1) Hard-coded C++

- everything is specified in the source code
- no user interaction

2) Batch session

- list of commands in macro file

3) Interactive session

- real-time input by the user
- by commands or graphical

Basic user interface

1) Hard-coded C++

- in main()

```
//Initialize G4 kernel  
runManager->Initialize();  
  
// Start a run  
G4int numberOfEvents = 1 ;  
runManager->BeamOn(numberOfEvents);  
  
delete runManager;
```

- Start a run by calling BeamOn and specifying the number of events

Basic user interface

2) Batch session

- in main()

```
//Initialize G4 kernel
runManager->Initialize();

// Get the pointer to the User Interface manager
//
G4UImanager * UImanager = G4UImanager::GetUIpointer();
G4String command = "/control/execute ";
G4String fileName = argv[1];
UImanager->ApplyCommand(command+fileName);

delete runManager;
```

- The macro is passed as command-line argument:

./name_of_the_executable macro

Basic user interface

3) Interactive session

- in main()

```
//Initialize G4 kernel  
runManager->Initialize();  
  
// interactive mode : define UI session  
G4UIExecutive * ui = new G4UIExecutive(argc,argv);  
ui->SessionStart();  
delete ui;  
  
delete runManager;
```

- Opens a graphical user interface
